- ▶ Outcomes/Education

# Cardiovascular System

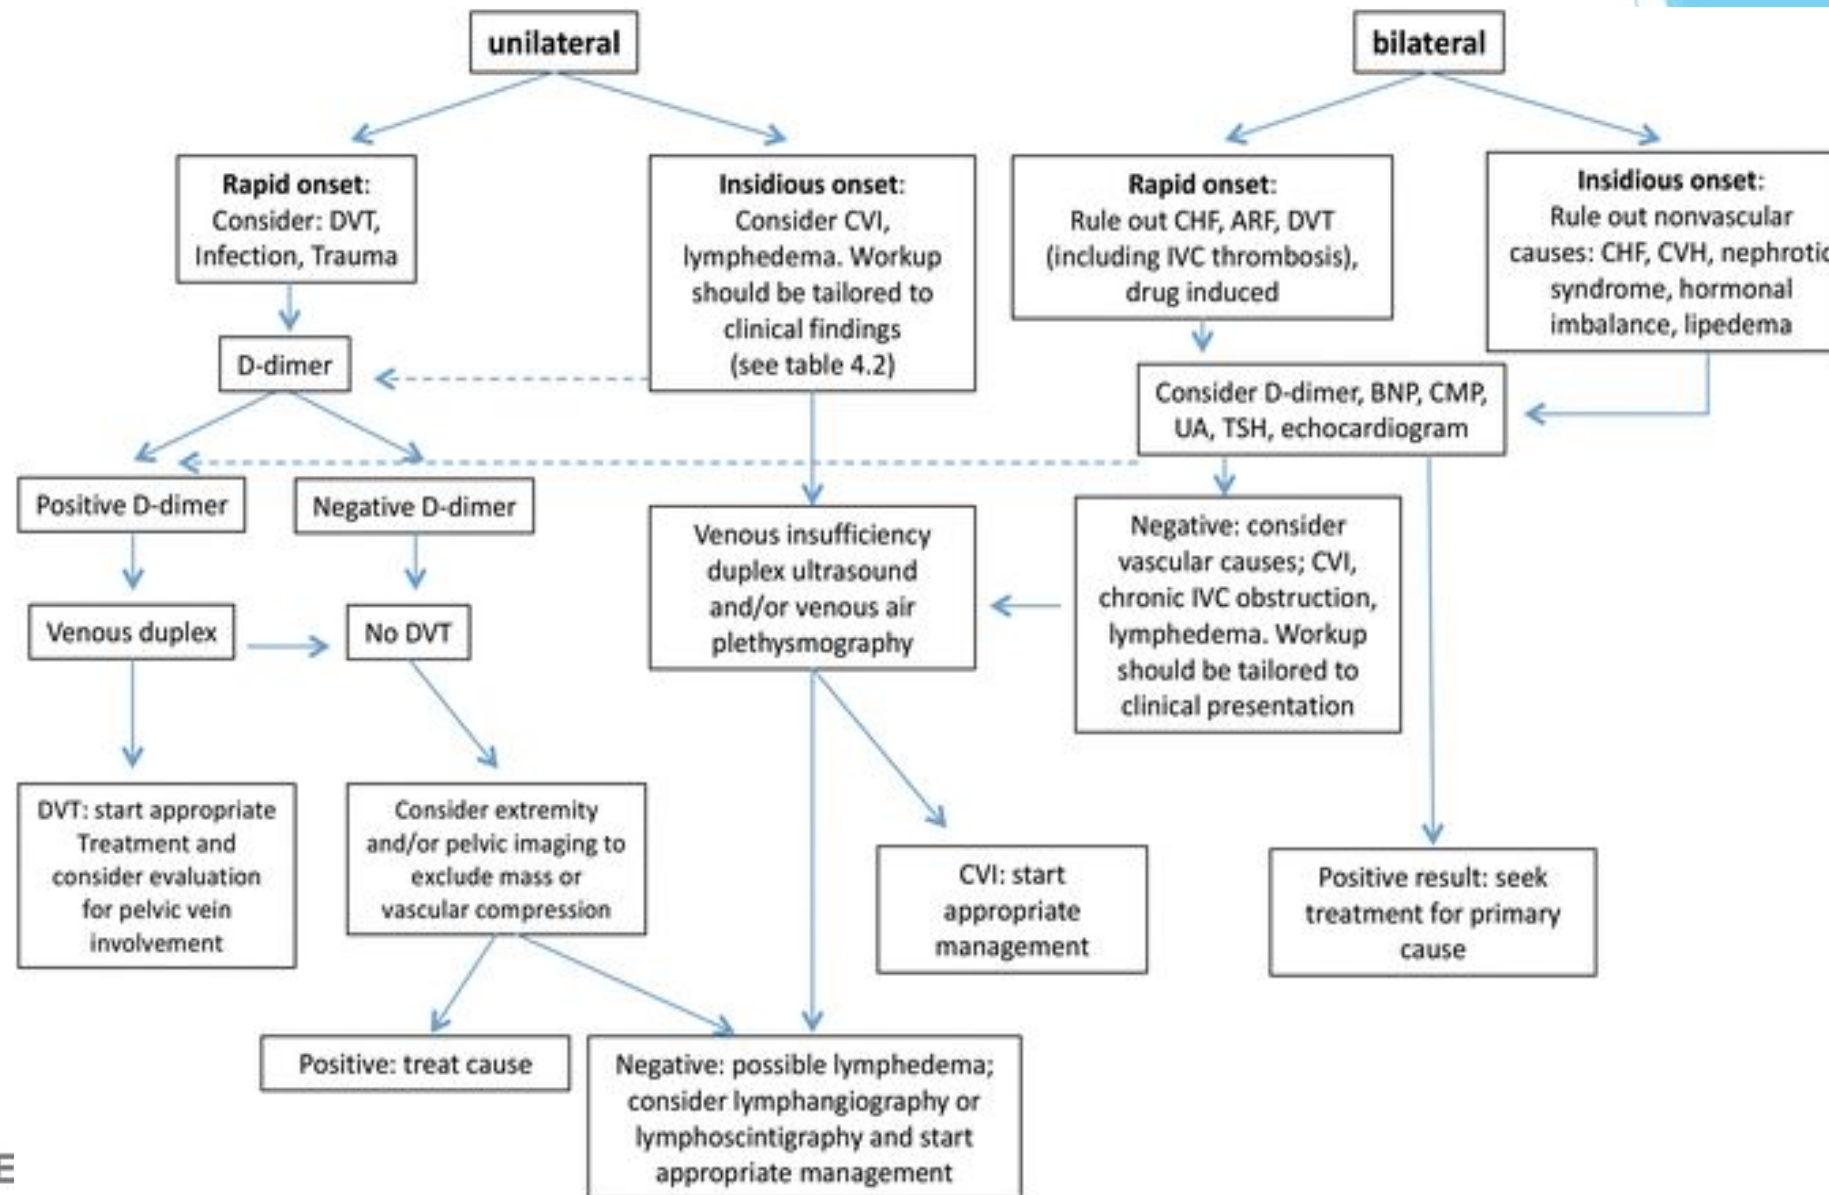

# Common Cardiovascular Complications in cancer treatments

1. Vascular toxicity (HTN)
2. Cardiomyopathy
3. Myocarditis
4. Arrhythmias/QTC prolongation
5. Venous Thromboembolism
6. Coronary Artery Vasospasm
7. Lymphedema

# CARDIOVASCULAR/Risk Factors

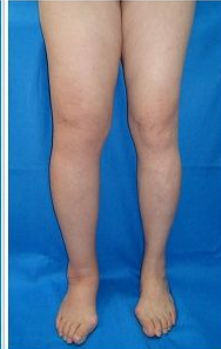

- ▶ Venous Thromboembolism
- ▶ PERICARDIAL EFFUSION
- ▶ CHF
- ▶ CORONARY ARTERY VASOSPASM
- ▶ Cancer, Immobility, Medication
- ▶ BREAST CANCER, RADIATION > 30% OF HEART IN FIELD, NARROWING PULSE PRESSURE LESS THAN 40 MMHG
- ▶ ANTHRACYCLINES CAUSE INCREASED FREE RADICALS THAT IMPEDE LVEF; CUMULATIVE DOSING LIMITS RISK
- ▶ ANTIMETABOLITES, 5FU

# CARDIOVASCULAR: EDEMA

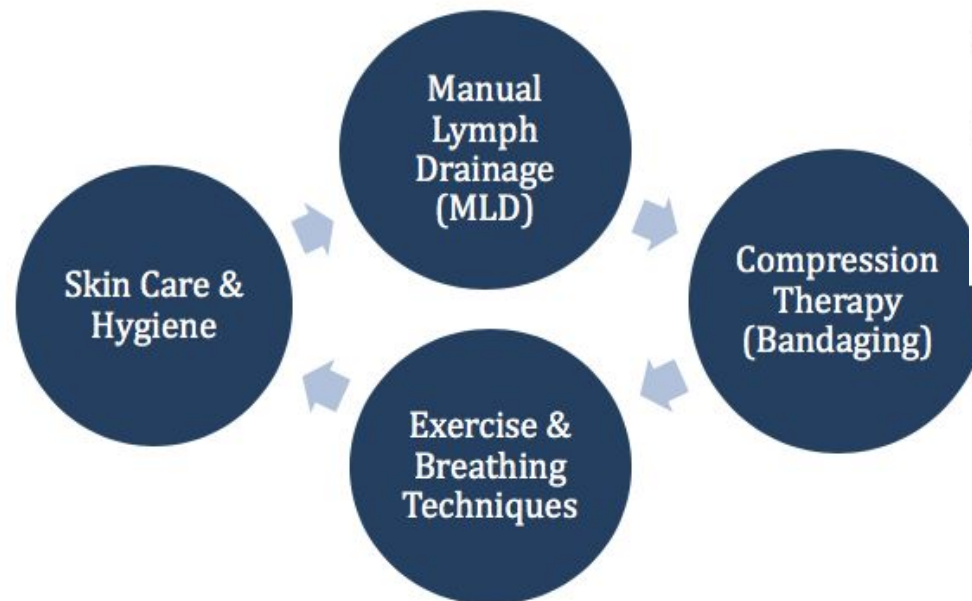

# CARDIOVASCULAR:LYMPHEDEMA

## LYMPHEDEMA GRADING

Grade	Grade I	Grade II	Grade III	Grade IV
Circumferential Difference	10-19%	20-29%	30-39%	40-49%
Clinical Image				

Grade	Features
0	Latent or subclinical condition where swelling is not evident despite impaired lymph transport, subtle alterations in tissue fluid/composition, and changes in subjective symptoms. It may exist months or years before overt edema occurs
1	Early accumulation of fluid relatively high in protein content (e.g., in comparison with “venous” edema) that subsides with limb elevation. Pitting may occur
2	Pitting may or may not occur as tissue fibrosis develops. Limb elevation alone rarely reduces tissue swelling
3	Lymphostatic elephantiasis where pitting is absent. Trophic skin changes, such as acanthosis, alterations in skin character and thickness, fat deposits and fibrosis, and warty overgrowths, often develop

# CARDIOVASCULAR SYMPTOMS

## LYMPHEDEMA

Lymph node  
obstruction/

# Respiratory System

# Common Respiratory Complications in cancer treatments

**CENTRAL CONNECTICUT**  
CHAPTER

# PULMONARY: DYSPPNEA

- ▶ Sensation of difficulty breathing
- ▶ Caused by increased ventilatory demand
- ▶ Impairment of the mechanical process of ventilation
- ▶ Potential life-threatening causes should be evaluated
  - ▶ Pulmonary embolus
  - ▶ Cardiac tamponade
  - ▶ Pleural effusion
  - ▶ Pneumonia
  - ▶ Anemia
  - ▶ Pneumonitis
  - ▶ Airway obstruction

# PULMONARY ASSESSMENT

- Can be subjective feeling of air hunger
- Unable to breathe in or out
- Chest tightness, rapid or shallow breathing
- Lung sounds, oxygen sat with ambulation, d dimer, ldh, cbc, procalcitonin

## Acute pneumonitis

Bleomycin  
Vinca alkaloids  
Methotrexate  
Procarbazine  
Carmustine  
Mitomycin

## Hypersensitivity pneumonitis

Procarbazine  
Azathioprine  
Bleomycin  
Methotrexate

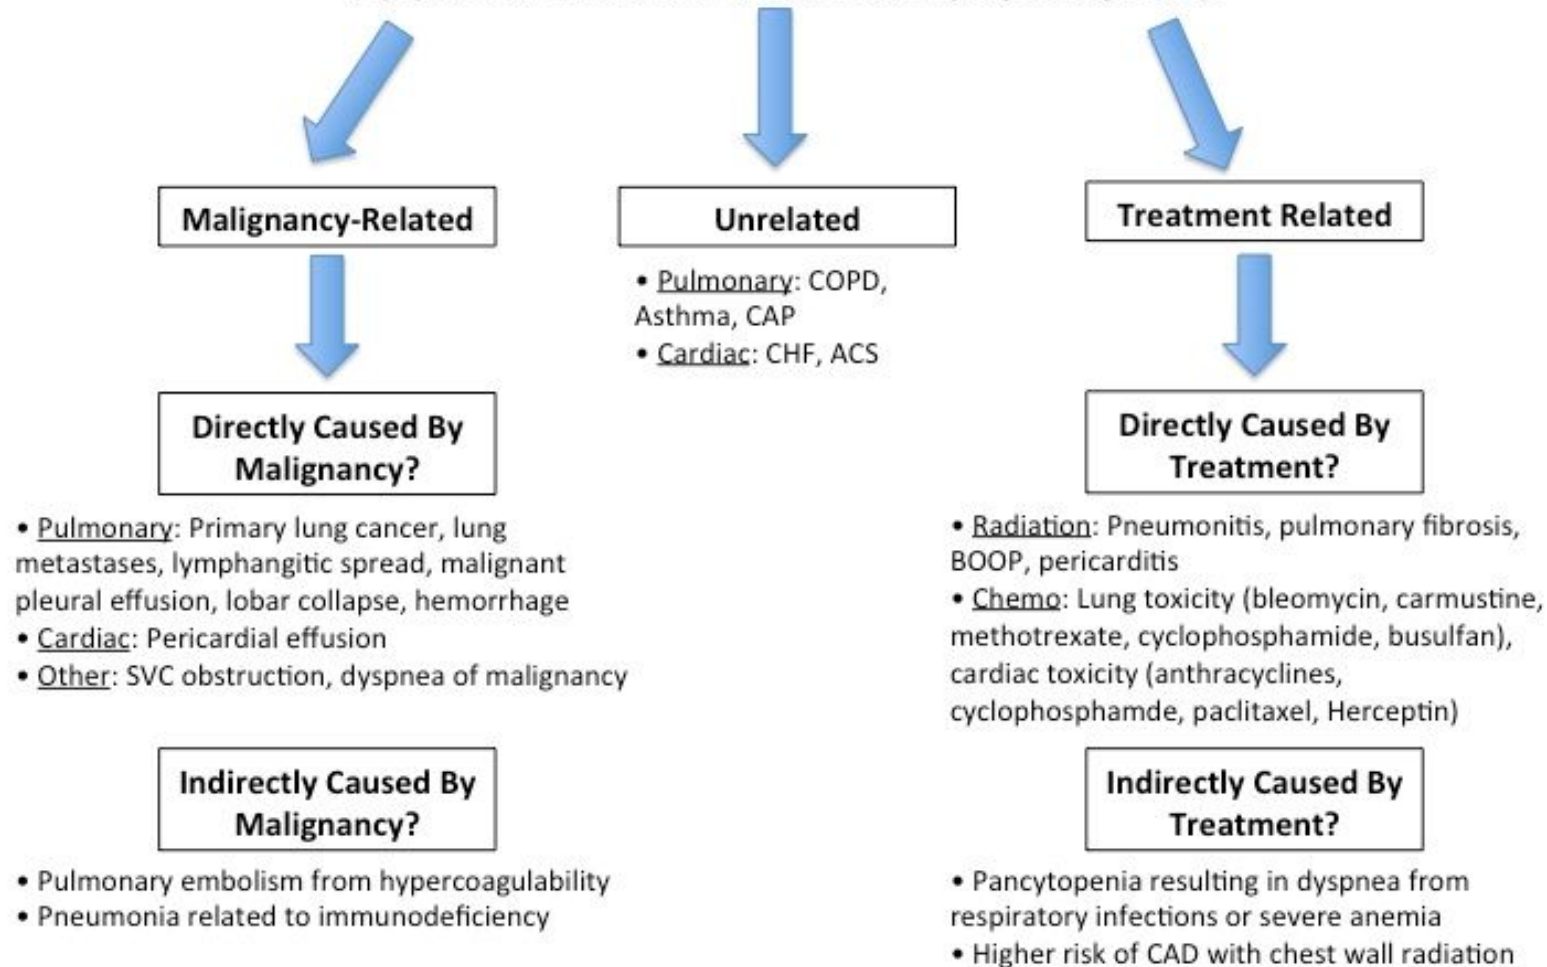

## Pulmonary fibrosis

Bleomycin

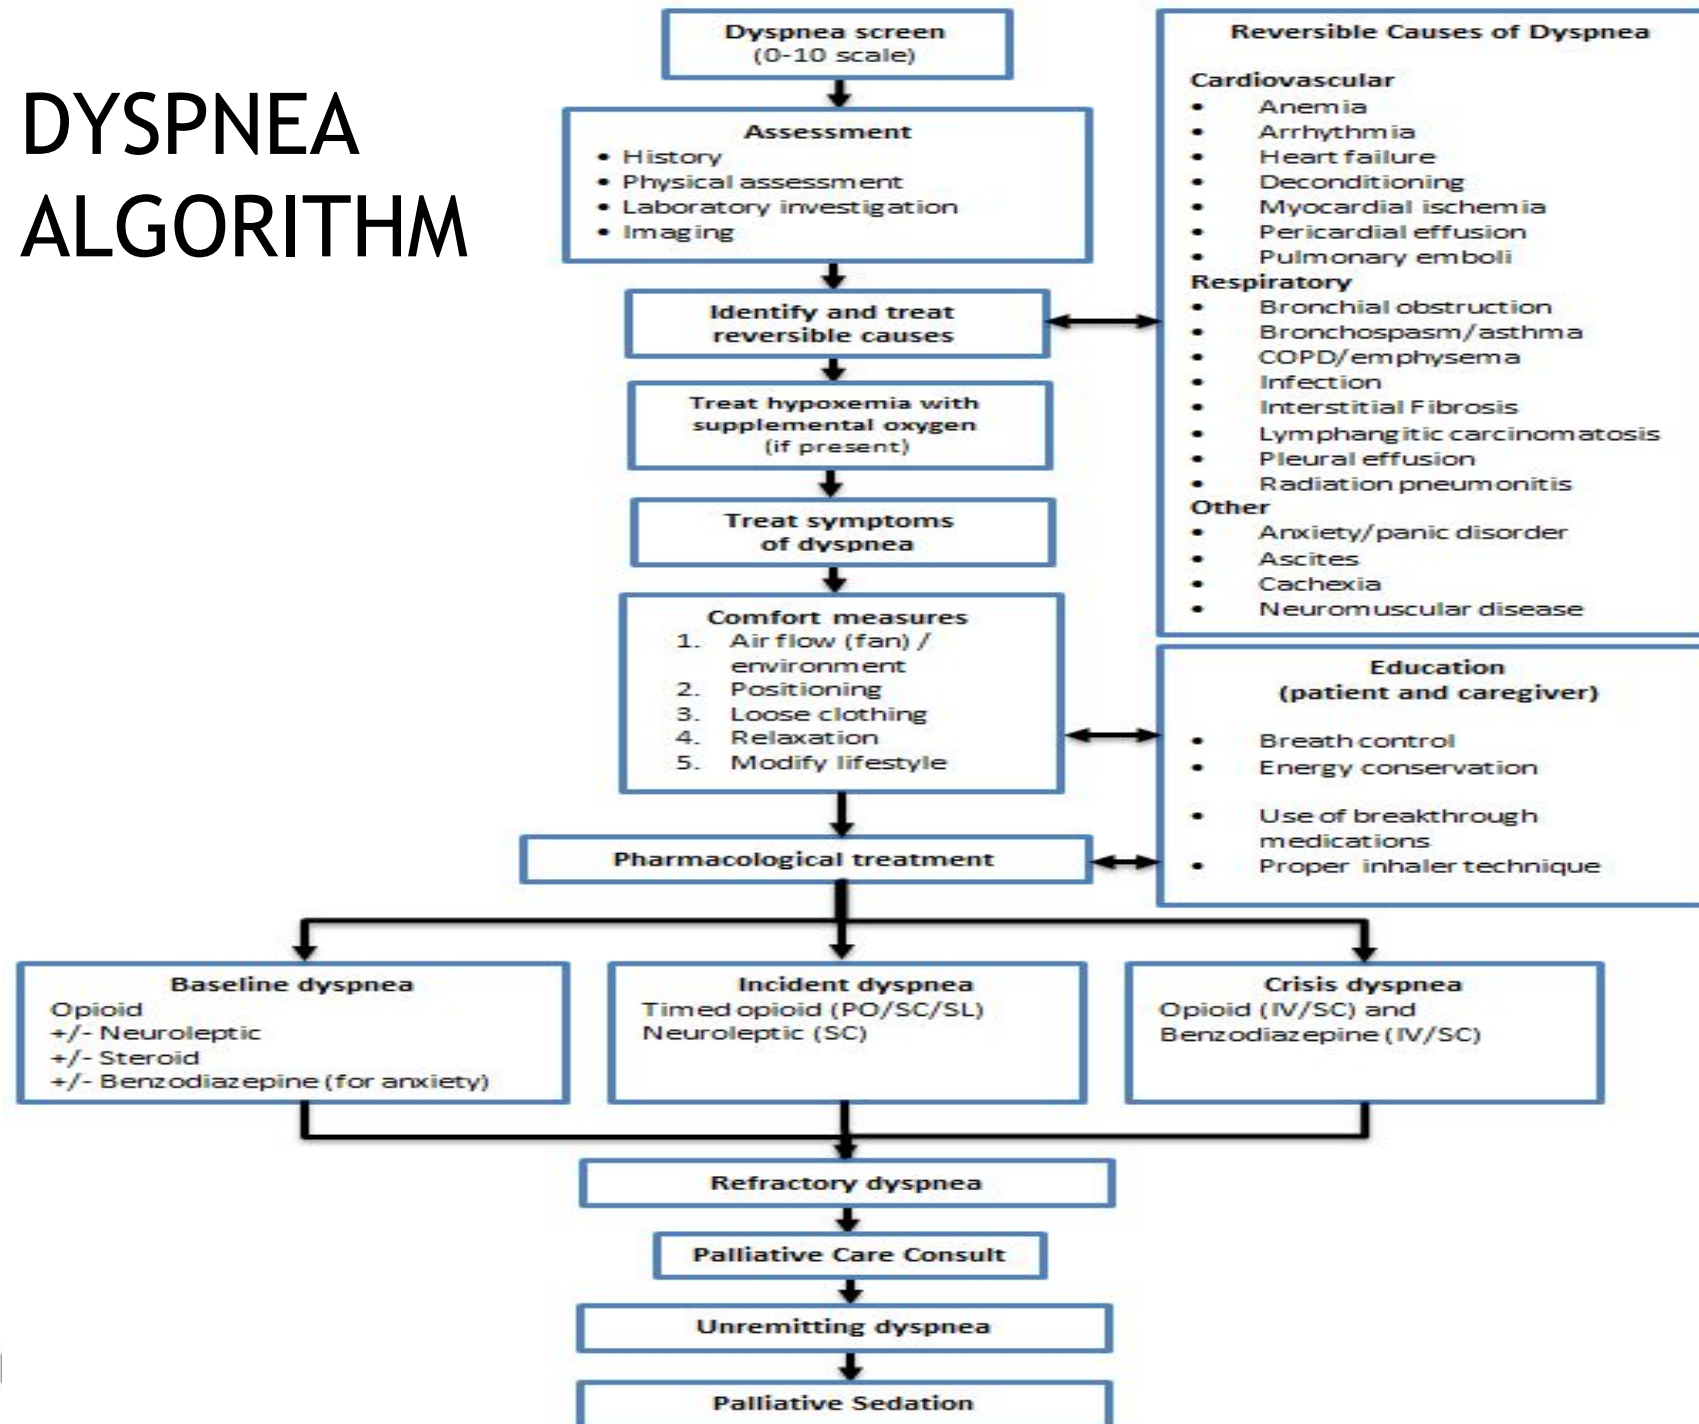

## Non cardiogenic pulmonary edema

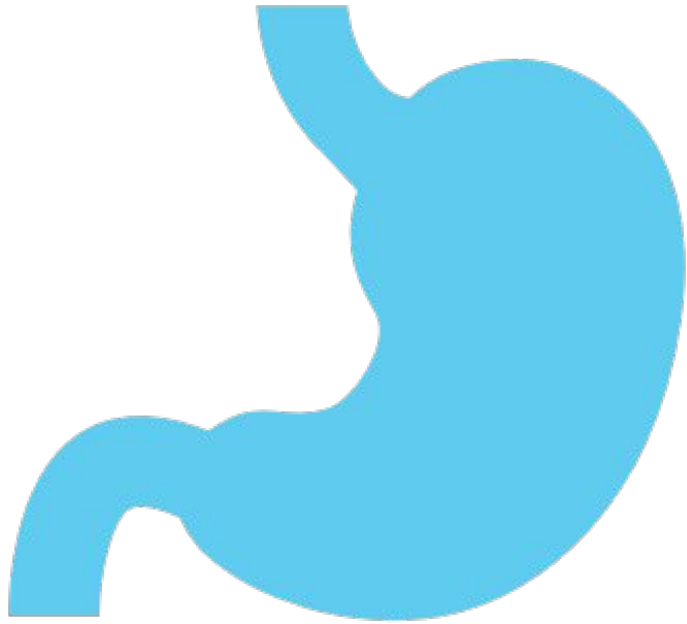

Cyclophosphamide  
Methotrexate  
Cytarabin  
Mitomycin

## Dyspnea in a Patient with an Underlying Malignancy

# DYSPNEA ALGORITHM

# Gastrointestinal System

# GASTROINTESTINAL

- ▶ Stomatitis/esophagitis/mucositis
- ▶ Aspiration
- ▶ Nausea/vomiting
- ▶ Ascites
- ▶ Diarrhea
- ▶ Constipation

# MUCOSITIS

> 50% of patients will experience

Can lead to dehydration, electrolyte imbalances, delays in tx

Defined as inflammation or lesions that occur anywhere in the GI tract

Causes include chemo, radiation to any area of GI tract, poor oral hygiene, smoking, etoh

Major offenders: MTX, 5FU, doxorubicin, head and neck radiation

# DRUGS THAT CAUSE MUCOSITIS

Alemtuzumab (Campath)	Etoposide (VePesid)	Mitomycin (Mutamycin)
Asparaginase (Elspar)	Fluorouracil (5-FU)	Mitoxantrone (Novantrone)
Bleomycin (Blenoxane)	Gemcitabine (Gemzar)	Oxaliplatin (Eloxatin)
Busulfan (Myleran, Busulfex)	Gemtuzumab ozogamicin (Mylotarg)	Paclitaxel (Taxol)
Capecitabine (Xeloda)	Hydroxyurea (Hydrea)	Pemetrexed (Alimta)
Carboplatin (Paraplatin)	Idarubicin (Idamycin)	Pentostatin (Nipent)
Cyclophosphamide (Cytosan)	Interleukin 2 (Proleukin)	Procarbazine (Matulane)
Cytarabine (Cytosar-U)	Irinotecan (Camptosar)	Thiotepa (Thiopex)
Daunorubicin (Cerubidine)	Lomustine (CeeNU)	Topotecan (Hycamtin)
Docetaxel (Taxotere)	Mechlorethamine (Mustargen)	Trastuzumab (Herceptin)
Doxorubicin (Adriamycin)	Melphalan (Alkeran)	Tretinoin (Vesanoid)
Epirubicin (Ellence)	Methotrexate (Rheumatrex)	Vinblastine (Velban)
		Vincristine (Oncovin)

# MUCOSITIS INTERVENTIONS

- ▶ Aggressive oral hygiene
- ▶ Oral cryotherapy
- ▶ Miracle mouthwash (Benadryl + Maalox +/- Lidocaine)
- ▶ Nystatin (only treats fungal infection)
- ▶ Saline or sodium bicarb rinses
- ▶ Avoidance of irritating foods, liquids

# CANCER CACHEXIA/ANOREXIA

Marker for poor prognosis

Hypermetabolic state in chronic inflammatory response

Nutritional supplements and appetite stimulation do not overcome changes in metabolic processes

Body weight is singular best measure

Cofactors include; nausea, constipation, diarrhea, taste changes, depression, inactivity

## NUTRITIONAL COUNSELING

Megace 800 mg daily.  
(risk of dvt, expense)  
Remeron (sleep,  
appetite, depression)  
medical marijuana

Steroids, short term

Medroxyprogesterone 1  
gram daily

Dronabinol  
(side effects helpful  
with nausea, mood  
more than weight gain)

Melatonin nightly  
(possibly)

Beta blockers

Mirtazapine/olanzapine

Incorporation of  
activity

# INTERVENTIONS

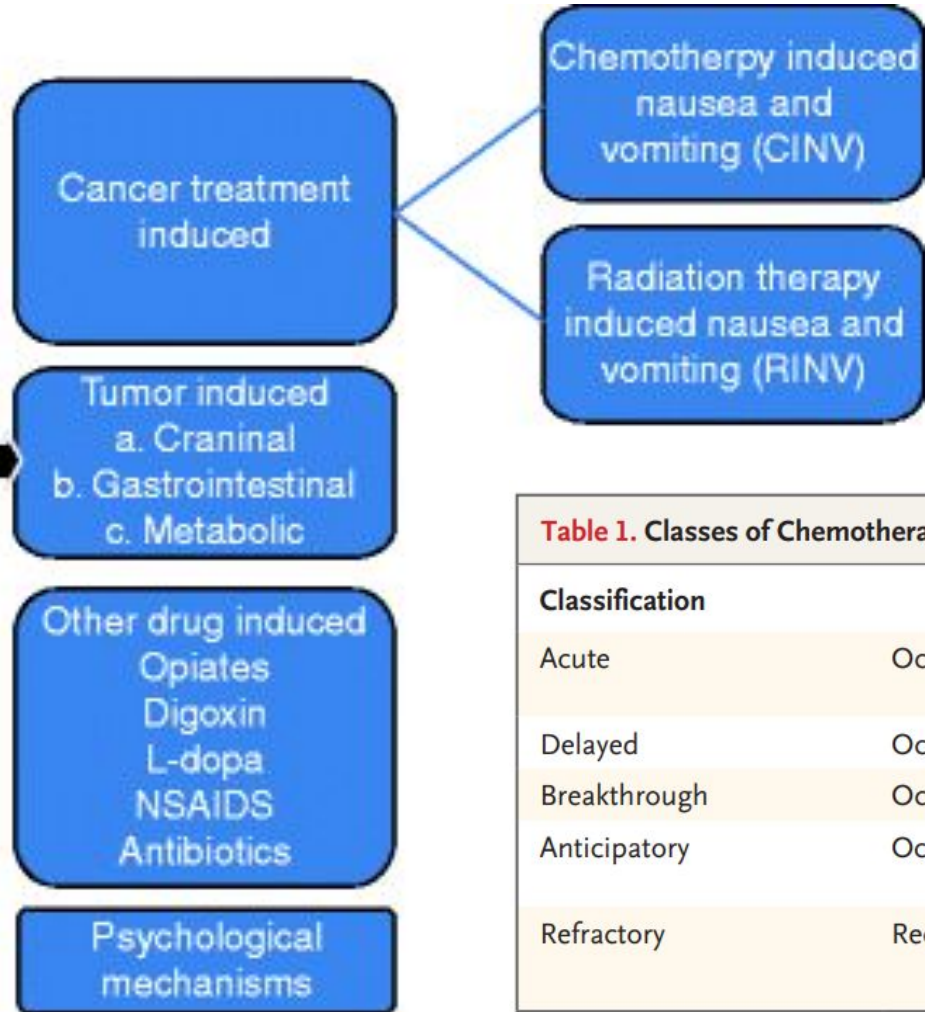

**Table 1. National Cancer Institute Common Terminology Criteria for Adverse Events: Gastrointestinal Toxicity**

ADVERSE EVENT	GRADE 1 (MILD)	GRADE 2 (MODERATE)	GRADE 3 (SEVERE)	GRADE 4 (LIFE THREATENING OR DISABLING)	GRADE 5 (DEATH)
Constipation	Occasional or intermittent symptoms; occasional use of stool softeners, laxatives, dietary modification, or enema	Persistent symptoms with regular use of laxatives or enemas indicated	Symptoms interfering with activities of daily living; obstipation with manual evacuation indicated	Life-threatening consequences (e.g., obstruction, toxic megacolon)	Death
Diarrhea	Increase of < 4 stools per day over baseline; mild increase in ostomy output compared to baseline	Increase of 4–6 stools per 24 hours over baseline; IV fluids indicated < 24 hours; moderate increase in ostomy output compared to baseline; not interfering with activities of daily living	Increase of 7 stools per 24 hours over baseline; incontinence; IV fluids 24 hours; hospitalization; severe increase in ostomy output compared to baseline; interfering with activities of daily living	Life-threatening consequences (e.g., hemodynamic collapse)	Death
Nausea	Loss of appetite without alteration in eating habits	Oral intake decreased without significant weight loss, dehydration or malnutrition; IV fluids indicated < 24 hours	Inadequate oral caloric or fluid intake; IV fluids, tube feedings, or total parenteral nutrition indicated 24 hours	Life-threatening consequences	Death
Vomiting	1 episode in 24 hours	2–5 episodes in 24 hours; IV fluids indicated < 24 hours	6 episodes in 24 hours; IV fluids or total parenteral nutrition indicated 24 hours	Life-threatening consequences	Death

*Note.* Based on information from National Cancer Institute, 2006.

# NAUSEA AND VOMITING

## Etiology of nausea and vomiting in cancer

**Table 1. Classes of Chemotherapy-Induced Nausea and Vomiting.**

Classification	Definition
Acute	Occurring within the first 24 hours after initiation of chemotherapy <sup>10</sup> ; generally peaks after 5 to 6 hours <sup>11</sup>
Delayed	Occurring from 24 hours to several days (days 2 to 5) after chemotherapy <sup>12</sup>
Breakthrough	Occurring despite appropriate prophylactic treatment <sup>13</sup>
Anticipatory	Occurring before a treatment as a conditioned response to the occurrence of chemotherapy-induced nausea and vomiting in previous cycles <sup>14</sup>
Refractory	Recurring in subsequent cycles of therapy, excluding anticipatory chemotherapy-induced nausea and vomiting <sup>13</sup>

# NAUSEA AND VOMITING

**Table 2.** Levels of Emetogenic Potential of Chemotherapeutic Agents.

Level	Emetogenic Potential (% of Patients with Emesis)
1	Minimal (0 to <10%)
2	Low (10 to 30%)
3	Moderate (>30 to 90%)
4	High (>90%)

**Table 1.** Emetic Classification of Antineoplastic Agents

High Risk	Moderate Risk	Low Risk	Minimal Risk
Cisplatin	Carboplatin	Mitoxantrone	Vinorelbine
Mechlorethamine	Cyclophosphamide ( $<1.5 \text{ g/m}^2$ )	Paclitaxel	Bevacizumab
Streptozotocin	Daunorubicin	Docetaxel	Rituximab
Cyclophosphamide ( $\geq 1.5 \text{ g/m}^2$ )	Doxorubicin	Mitomycin	Bleomycin
Carmustine	Epirubicin	Topotecan	Vinblastine
Dacarbazine	Idarubicin	Gemcitabine	Vincristine
Dactinomycin	Oxaliplatin	Etoposide	Busulfan
	Cytarabine ( $>1 \text{ g/m}^2$ )	Pemetrexed	Fludarabine
	Ifosfamide	Methotrexate	2-Chlorodeoxyadenosine
	Irinotecan	Cytarabine ( $<1 \text{ g/m}^2$ )	
		Fluorouracil	
		Bortezomib	
		Cetuximab	
		Trastuzumab	

Source: Reference 1.

# NAUSEA AND VOMITING

**Table 5. Risk Factors for Chemotherapy-Induced Nausea and Vomiting (CINV)**

**Patient-related**

- Previous episodes of CINV
- Age < 50 years
- Female gender
- History of pregnancy-associated nausea and vomiting
- History of motion sickness
- History of no or very limited alcohol intake

**Treatment-related**

- Emetogenicity of cytotoxic regimen
- Chemotherapy dose
- Route and rate of administration of chemotherapy

The risk for developing CINV increases with the number of risk factors.

**TABLE: DRUGS USED FOR CHEMOTHERAPY-INDUCED NAUSEA AND VOMITING**

Drug Class	Notes
5-HT <sub>3</sub> -receptor antagonists (dolasetron, granisetron, ondansetron, palonosetron)	<ul style="list-style-type: none"><li>Used for acute emesis with corticosteroids and NK<sub>1</sub>-receptor antagonists</li></ul>
Antihistamines (diphenhydramine)	<ul style="list-style-type: none"><li>Useful additions to antiemetic drugs</li></ul>
Benzodiazepines (alprazolam, lorazepam, midazolam) and thienobenzodiazepine (olanzapine)	<ul style="list-style-type: none"><li>Useful additions to antiemetic drugs</li><li>Drugs of choice for anticipatory emesis</li><li>Olanzapine is reserved for refractory CINV</li></ul>
Butyrophenones (droperidol, haloperidol)	<ul style="list-style-type: none"><li>Usually used for breakthrough symptoms</li></ul>
Cannabinoids (dronabinol, nabilone)	<ul style="list-style-type: none"><li>Second-line therapy</li></ul>
Corticosteroids (dexamethasone, methylprednisolone)	<ul style="list-style-type: none"><li>Increase 5-HT<sub>3</sub> receptor antagonists effectiveness</li><li>Can be used alone with chemotherapy of low emetogenic risk</li></ul>
Dopamine-receptor antagonists (metoclopramide, prochlorperazine)	<ul style="list-style-type: none"><li>Usually used for delayed CINV</li></ul>
NK <sub>1</sub> -receptor antagonists (aprepitant, fosaprepitant)	<ul style="list-style-type: none"><li>Used for acute emesis</li></ul>

CINV = chemotherapy-induced nausea and vomiting; HT = hydroxytryptamine; NK = neurokinin. Adapted from references 2, 8-12.

# DIARRHEA

## CHEMOTHERAPY RELATED

- fluoropyrimidines (particularly fluorouracil [5FU] and capecitabine)
- irinotecan
- docetaxel

## MOLECULAR TARGETED AGENTS

- sorafenib
- sunitinib
- afatinib

## EGFR AGENTS

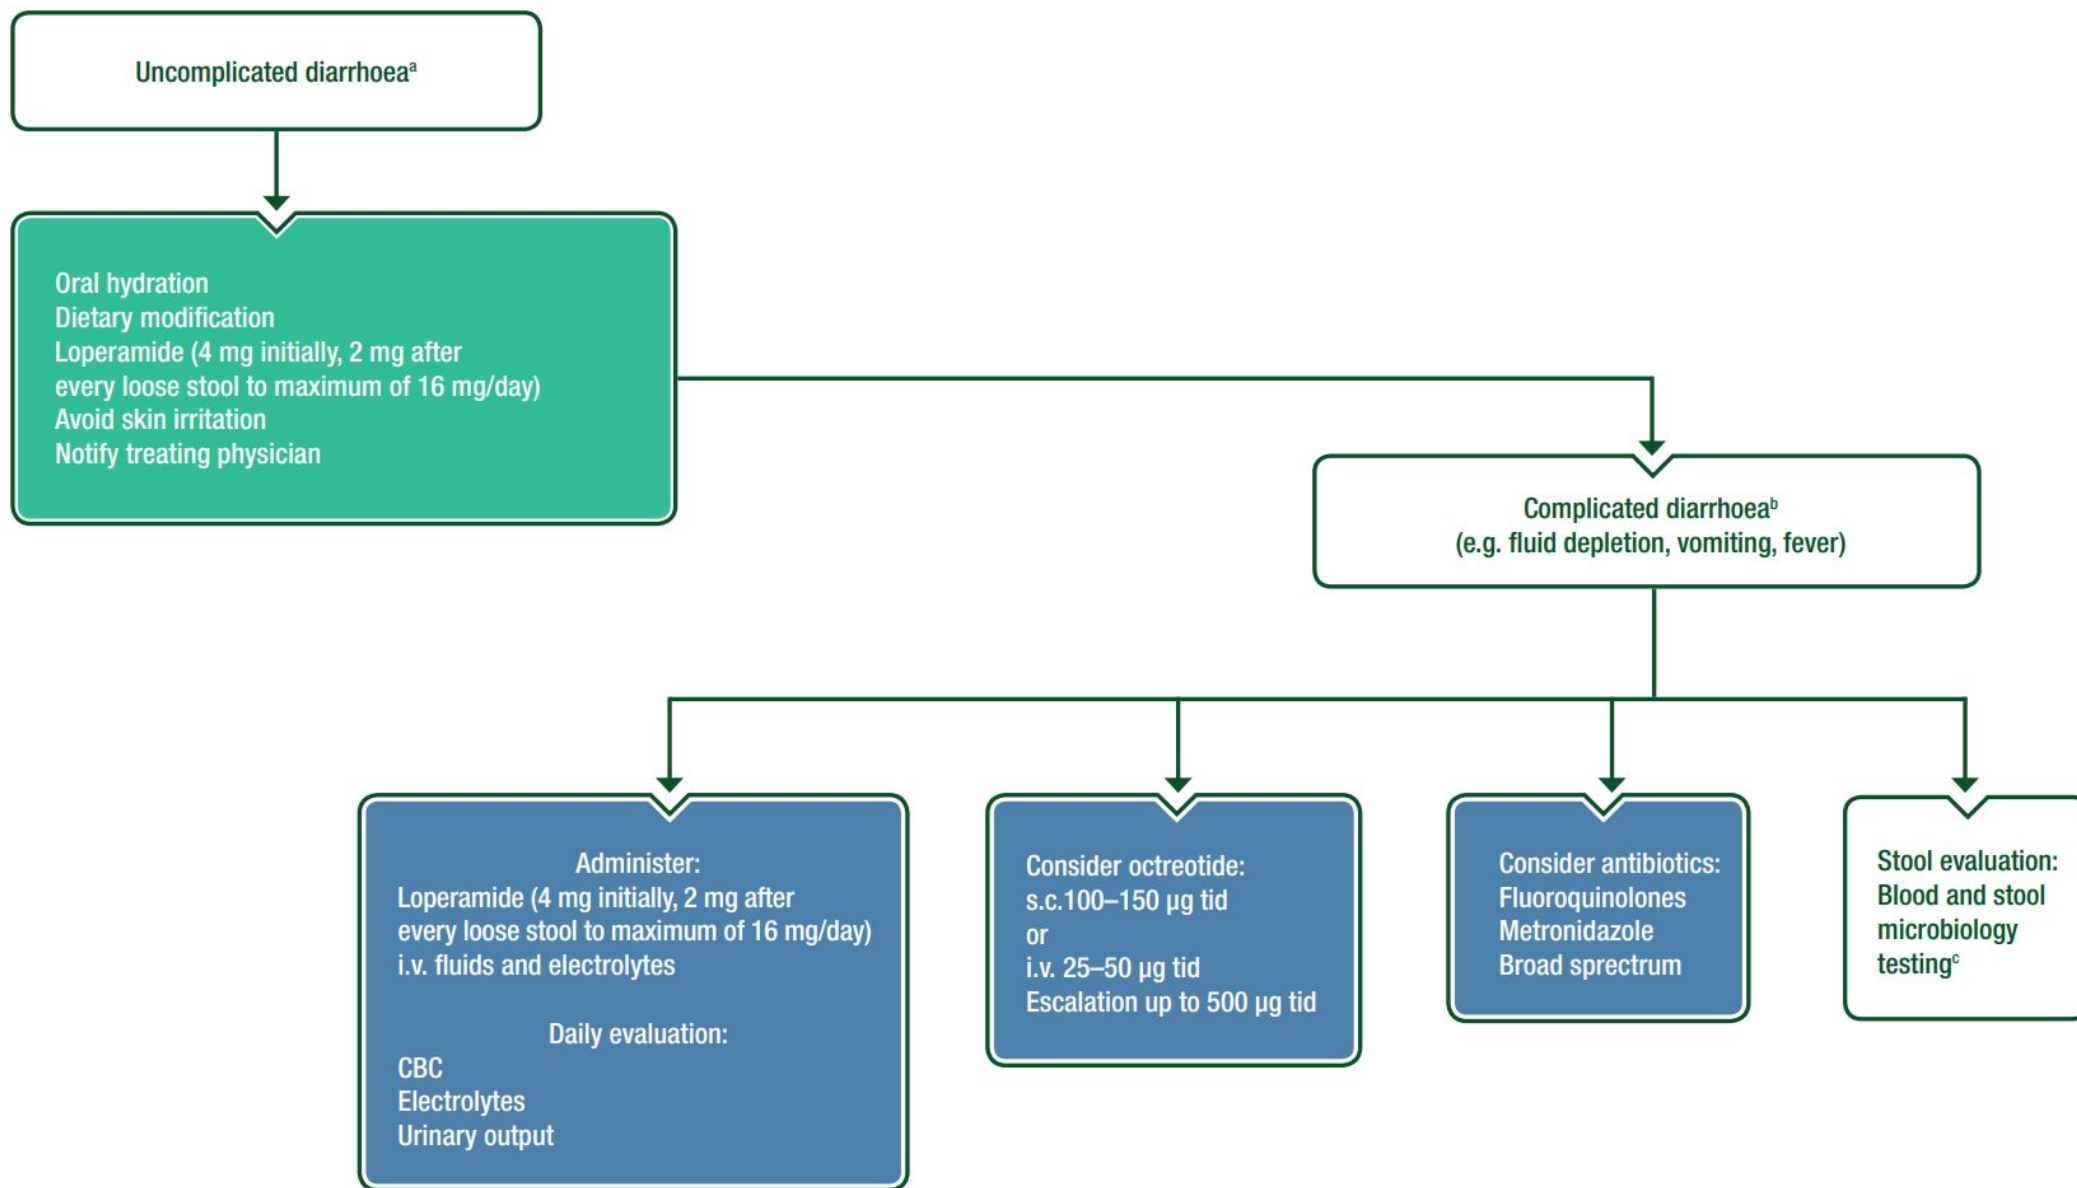

- lapatinib, aflibercept

## IMMUNE CHECKPOINT INHIBITORS

- ipilimumab
- nivolumab
- pembrolizumab

## DIARRHEA CAN ALSO BE....

- INFECTIOUS
- MALABSORPTION(ILEOSTOMY)
- OTHER MEDICATION RELATED (METOCLOPRAMIDE, ANTIBX)
- TYPHLITIS (CECUM INFLAMMATION)
- RADIATION TO PELVIS, INTESTINE

**Figure 2.** Algorithm for therapeutic approach.

<sup>a</sup>Treatment setting: ambulatory and/or outpatient supportive care outpatient unit.

<sup>b</sup>In-hospital treatment.

<sup>c</sup>Consider *Clostridium difficile*, *Salmonella*, *Campylobacter* and other causes of infectious colitis.

CBC, complete blood count; i.v., intravenous; s.c., subcutaneous; tid, three times a day.

GASTROINTESTINAL ADVERSE EVENT(S)	ASSESSMENT/GRADING	MANAGEMENT <sup>h</sup>
<ul style="list-style-type: none"> <li>• Diarrhea</li> <li>• Colitis<sup>a</sup></li> </ul>	<ul style="list-style-type: none"> <li>• Stool evaluation to rule out infectious etiology<sup>b</sup> <ul style="list-style-type: none"> <li>▶ Nucleic acid amplification tests (NAATs) for GI pathogens/bacterial culture</li> <li>▶ <i>C. difficile</i></li> <li>▶ Ova &amp; parasites; molecular testing for <i>Giardia</i> and <i>Cryptosporidium</i> spp and <i>E. histolytica</i>; consider microsporidia, <i>Cyclospora/isospora</i> spp</li> <li>▶ Viral pathogens testing when available</li> <li>▶ Based on institutional availability, consider lactoferrin/calprotectin<sup>c</sup></li> </ul> </li> <li>• Infectious disease screening (HIV; hepatitis A, B, C) as clinically indicated</li> <li>• Consider abdominal/pelvic CT with contrast if G2–G4 colitis<sup>a</sup></li> <li>• Consider GI consultation if G2–G4               <ul style="list-style-type: none"> <li>▶ Colonoscopy or flexible sigmoidoscopy ± esophagogastroduodenoscopy (EGD) with biopsy<sup>c</sup></li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Consider holding immunotherapy<sup>i</sup></li> <li>• Loperamide or diphenoxylate/atropine for 2–3 days               <ul style="list-style-type: none"> <li>▶ If no improvement and not already done, obtain labs for infectious workup</li> </ul> </li> <li>• Hydration</li> <li>• Close monitoring<sup>j</sup></li> <li>• If persistent or progressive symptoms, check lactoferrin/calprotectin<sup>k</sup> <ul style="list-style-type: none"> <li>▶ If positive, treat as G2 (below)</li> <li>▶ If negative and no infection, continue G1 management and add mesalamine, cholestyramine</li> </ul> </li> </ul>
	Mild (G1) <sup>d</sup> →	<ul style="list-style-type: none"> <li>• Hold immunotherapy<sup>i</sup></li> <li>• Prednisone/methylprednisolone<sup>l</sup> (1–2 mg/kg/day)<sup>m</sup></li> <li>• No response in 2–3 days, continue steroids, consider adding infliximab<sup>n,o,p</sup> or vedolizumab<sup>p</sup> within 2 weeks<sup>q</sup></li> </ul>
	Moderate (G2) <sup>e,f</sup> →	<ul style="list-style-type: none"> <li>• Hold immunotherapy<sup>i</sup></li> <li>• Prednisone/methylprednisolone<sup>l</sup> (1–2 mg/kg/day)<sup>m</sup></li> <li>• No response in 2–3 days, continue steroids, consider adding infliximab<sup>n,o,p</sup> or vedolizumab<sup>p</sup> within 2 weeks<sup>q</sup></li> </ul>
	Severe (G3–4) <sup>g</sup> →	<a href="#">See ICI GI-2</a>
	Severe (G3–4) <sup>g</sup> diarrhea or colitis →	<ul style="list-style-type: none"> <li>• G3: Discontinue anti-CTLA-4; consider resuming anti-PD-1/PD-L1 after resolution of toxicity<sup>l</sup></li> <li>• G4: Permanently discontinue immunotherapy agent responsible for toxicity<sup>i</sup></li> <li>• Consider inpatient care for provision of supportive care</li> <li>• Intravenous (IV) methylprednisolone<sup>l</sup> (1–2 mg/kg/day)<sup>m</sup> <ul style="list-style-type: none"> <li>▶ No response in 1–2 days, continue steroids, strongly consider adding infliximab<sup>n,o,p</sup> or vedolizumab<sup>p,q,r</sup></li> </ul> </li> </ul>

# CHEMO BRAIN

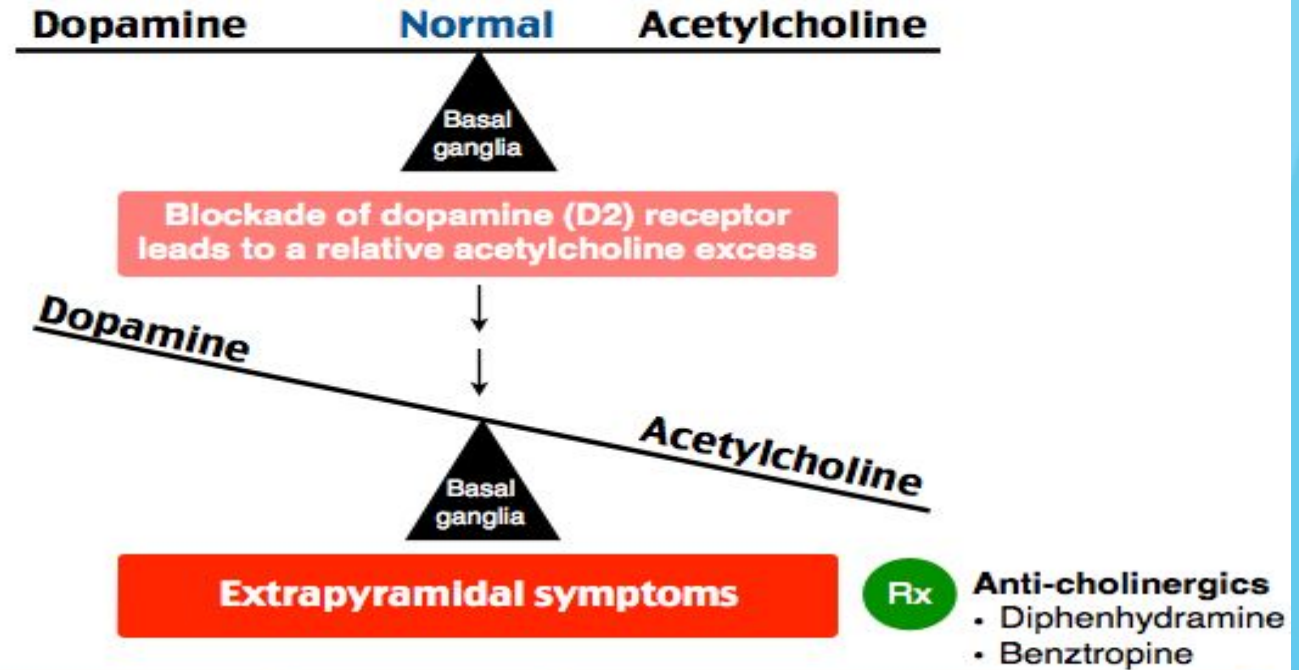

# Quietly delirious

Hypoactive delirium can be more difficult to recognise than hyperactive delirium, and is associated with worse outcomes. This infographic summarises the main differences between the two forms of delirium.

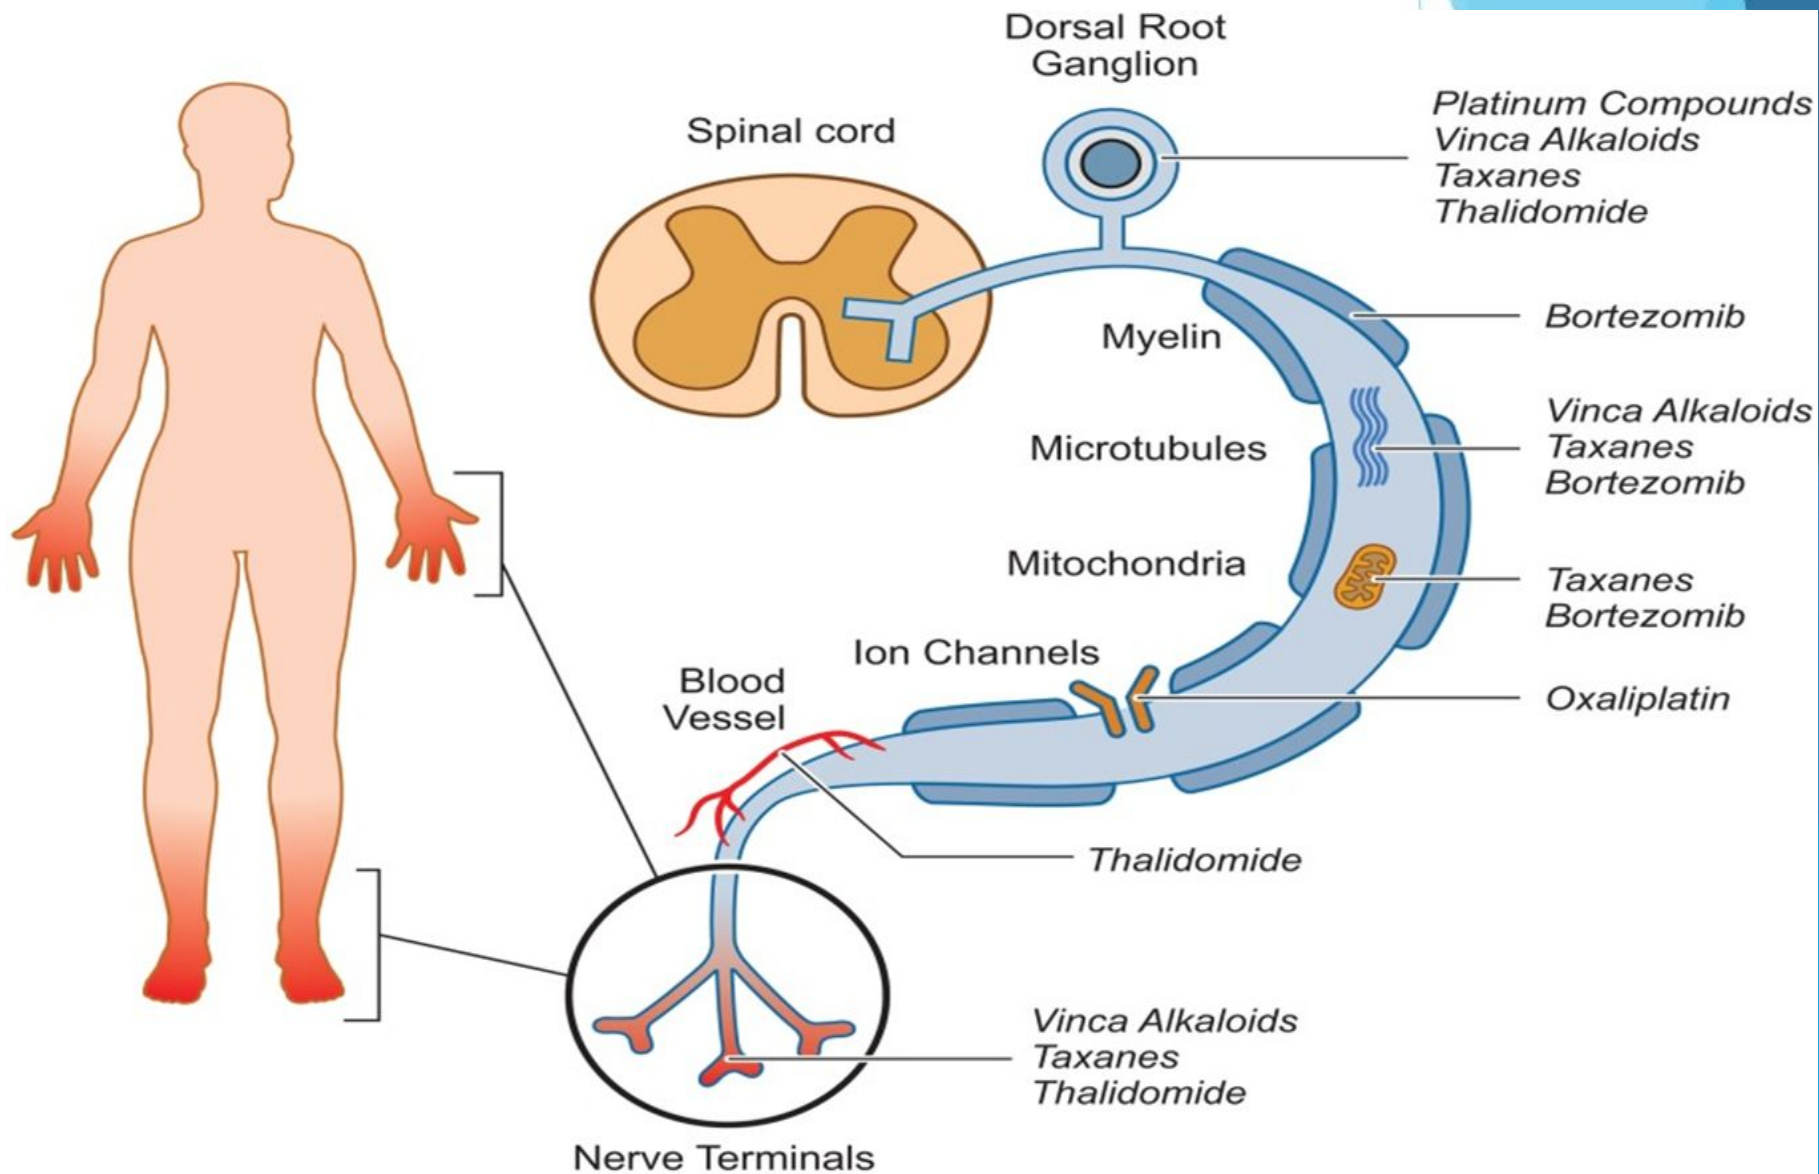

\* DSM-5 = Diagnostic and Statistical Manual of Mental Disorders (fifth edition)

# Extrapyramidal symptoms

Reaction	Onset	Features
Acute dystonia	Hours to days	<ul style="list-style-type: none"> <li>• Spasm of tongue, neck, face and back</li> </ul>
Parkinsonism	5 to 30 days	<ul style="list-style-type: none"> <li>• Tremor</li> <li>• Shuffling gait</li> <li>• Drooling</li> <li>• Stooped posture</li> <li>• Instability</li> </ul>
Akathisia	5 to 60 days	<ul style="list-style-type: none"> <li>• Compulsive, repetitive motions</li> <li>• Agitation</li> </ul>
Tardive dyskinesia	Months to years	<ul style="list-style-type: none"> <li>• Lip smacking</li> <li>• Worm-like tongue movements</li> <li>• "Fly-catching"</li> </ul>

# NEUROLOGIC TOXICITY

# SLEEP DISTURBANCES

Often in combination with anxiety, fatigue and inactivity

Sleep disturbances are subjective sensation actual or perceived of disturbances in night-time sleep cycle

2 phases to the sleep wake cycle:

Rem and non rem (active vs restful), each lasts about 90 mins over a 7-8-hour period

If persistent disturbances, a polysomnography will detect breathing disorders or limb movement disorders

# Genitourinary System

# GENITOURINAR Y FACTORS:

## Chemotherapy

- Cyclophosphamide, ifos, mtx, cisplatin, targeted agents (bevacizumab, sorafenib)

## Infection

- Uti, pyelonephritis

## Radiation

- Bladder or pelvis

## Cancer progression

- Ureteral obstruction

## Metabolic abnormalities

- Hypercalcemia, hyperglycemia

## Medications

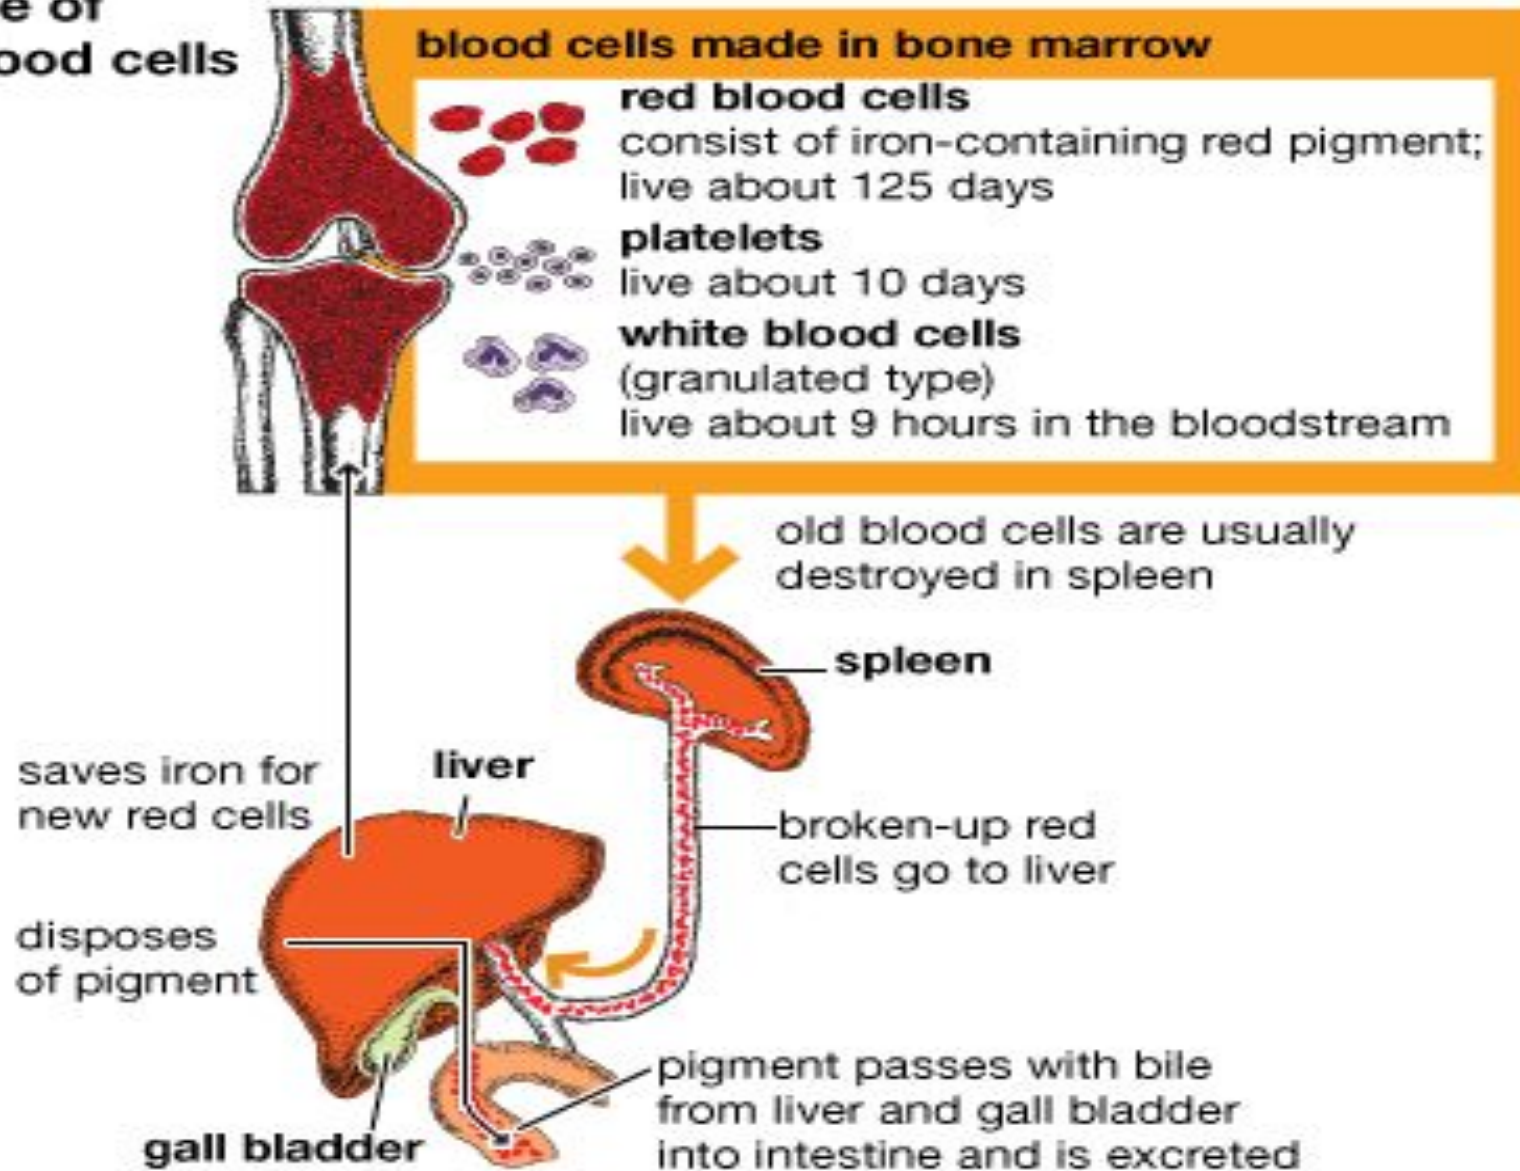

- Opiates, bisphosphonates

## Stool impaction

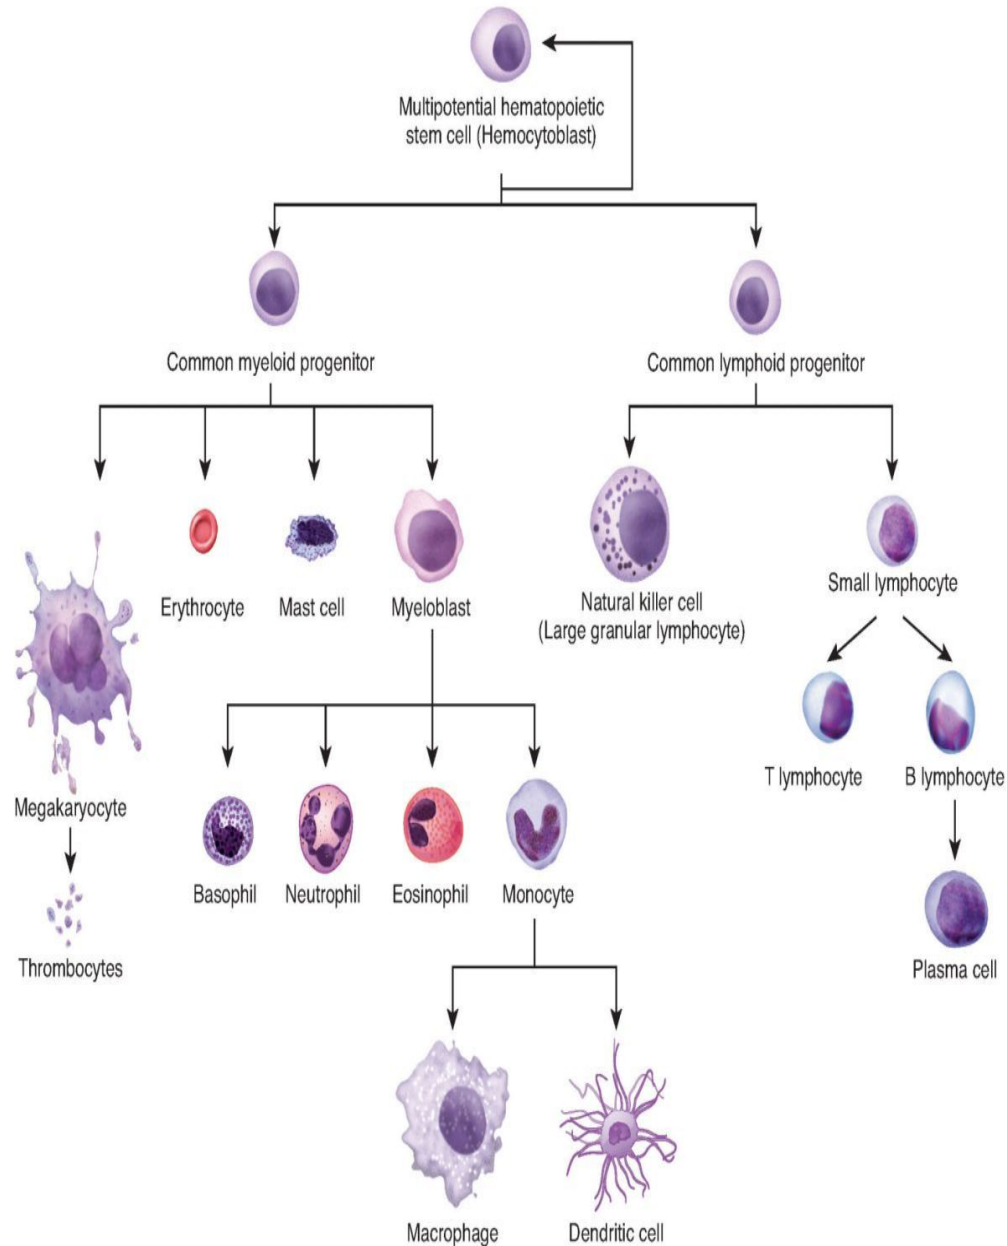

# Hematological System

# HEMATOLOGIC:

## Life cycle of some blood cells

# HEMATOLOGIC

## SITES OF MARROW PRODUCTION

### In children

- All bones with red bone marrow
- Liver & spleen

### In adults (after 20yrs)

- Ends of long bones like femur, humerus
- Skull
- Vertbrae
- Ribs
- Sternum
- pelvis

# CALCULATION OF ANC

## Absolute Neutrophil Count

$$\text{ANC} = \frac{(\% \text{neutrophils} + \% \text{bands}) * \text{WBC}}{100}$$

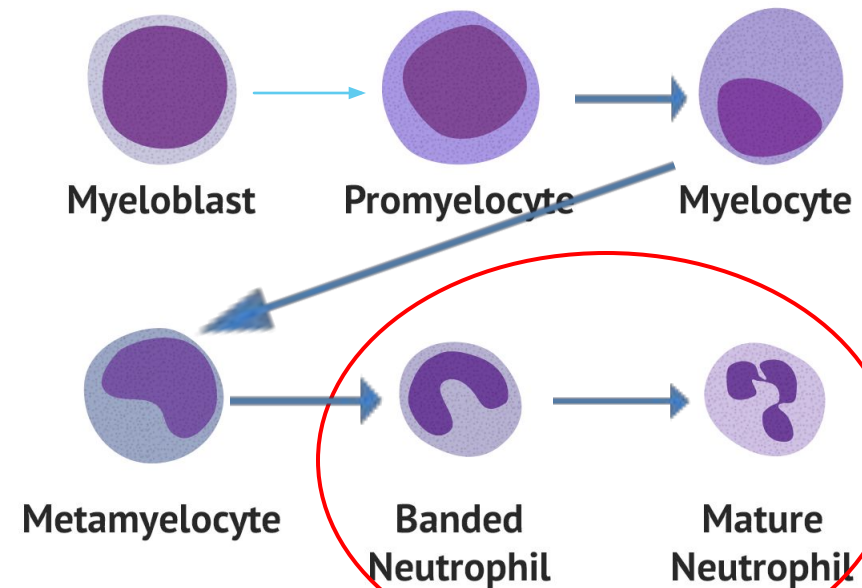

**ONS**  
Oncology Nursing Society  
Where Oncology Nurses Connect

**Example #1**

- Total WBC count = 1600
- Polys= 48
- Bands= 5
- Add polys and bands:  $48 + 5 = 53$
- Convert to a percentage:  $53/100 = .53 = 53\%$
- Multiple total WBC count by percentage to find ANC:  $1600 \times 0.53$

**ANC = 848**

**CENTRAL CONNECTIONS**  
CHAPTER

# VTE

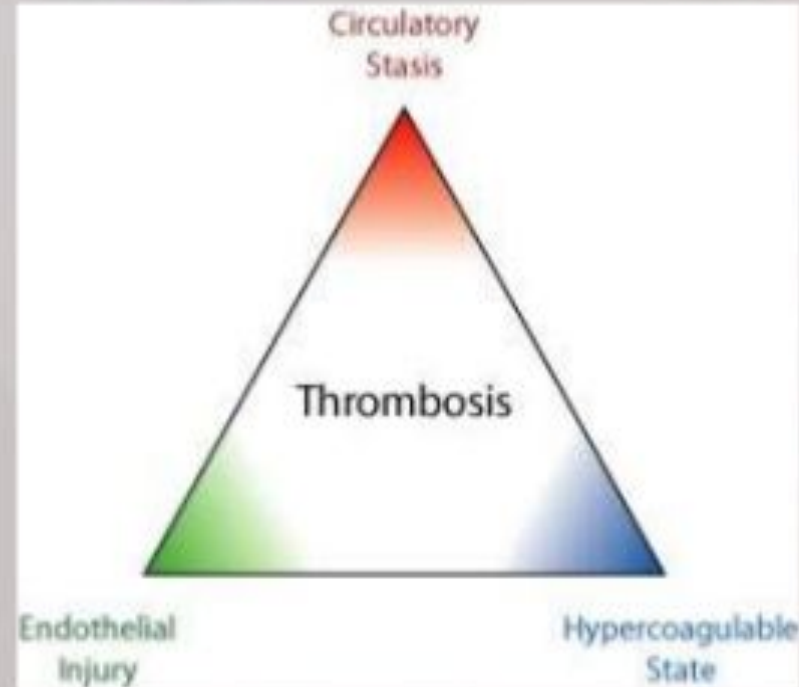

## Risk factors

### Stasis

Immobility/cast/travel  
Advanced age  
Acute medical illness  
Major surgery  
Spinal cord injury  
Obesity

### Endothelial Damage

Major surgery  
Trauma  
Central venous  
catheterization

### Hypercoagulability

Hereditary Deficiencies:

Antithrombin deficiency  
Protein C deficiency  
Protein S deficiency  
Factor V Leiden  
Prothrombin gene mutation  
Dysfibrinogenemia

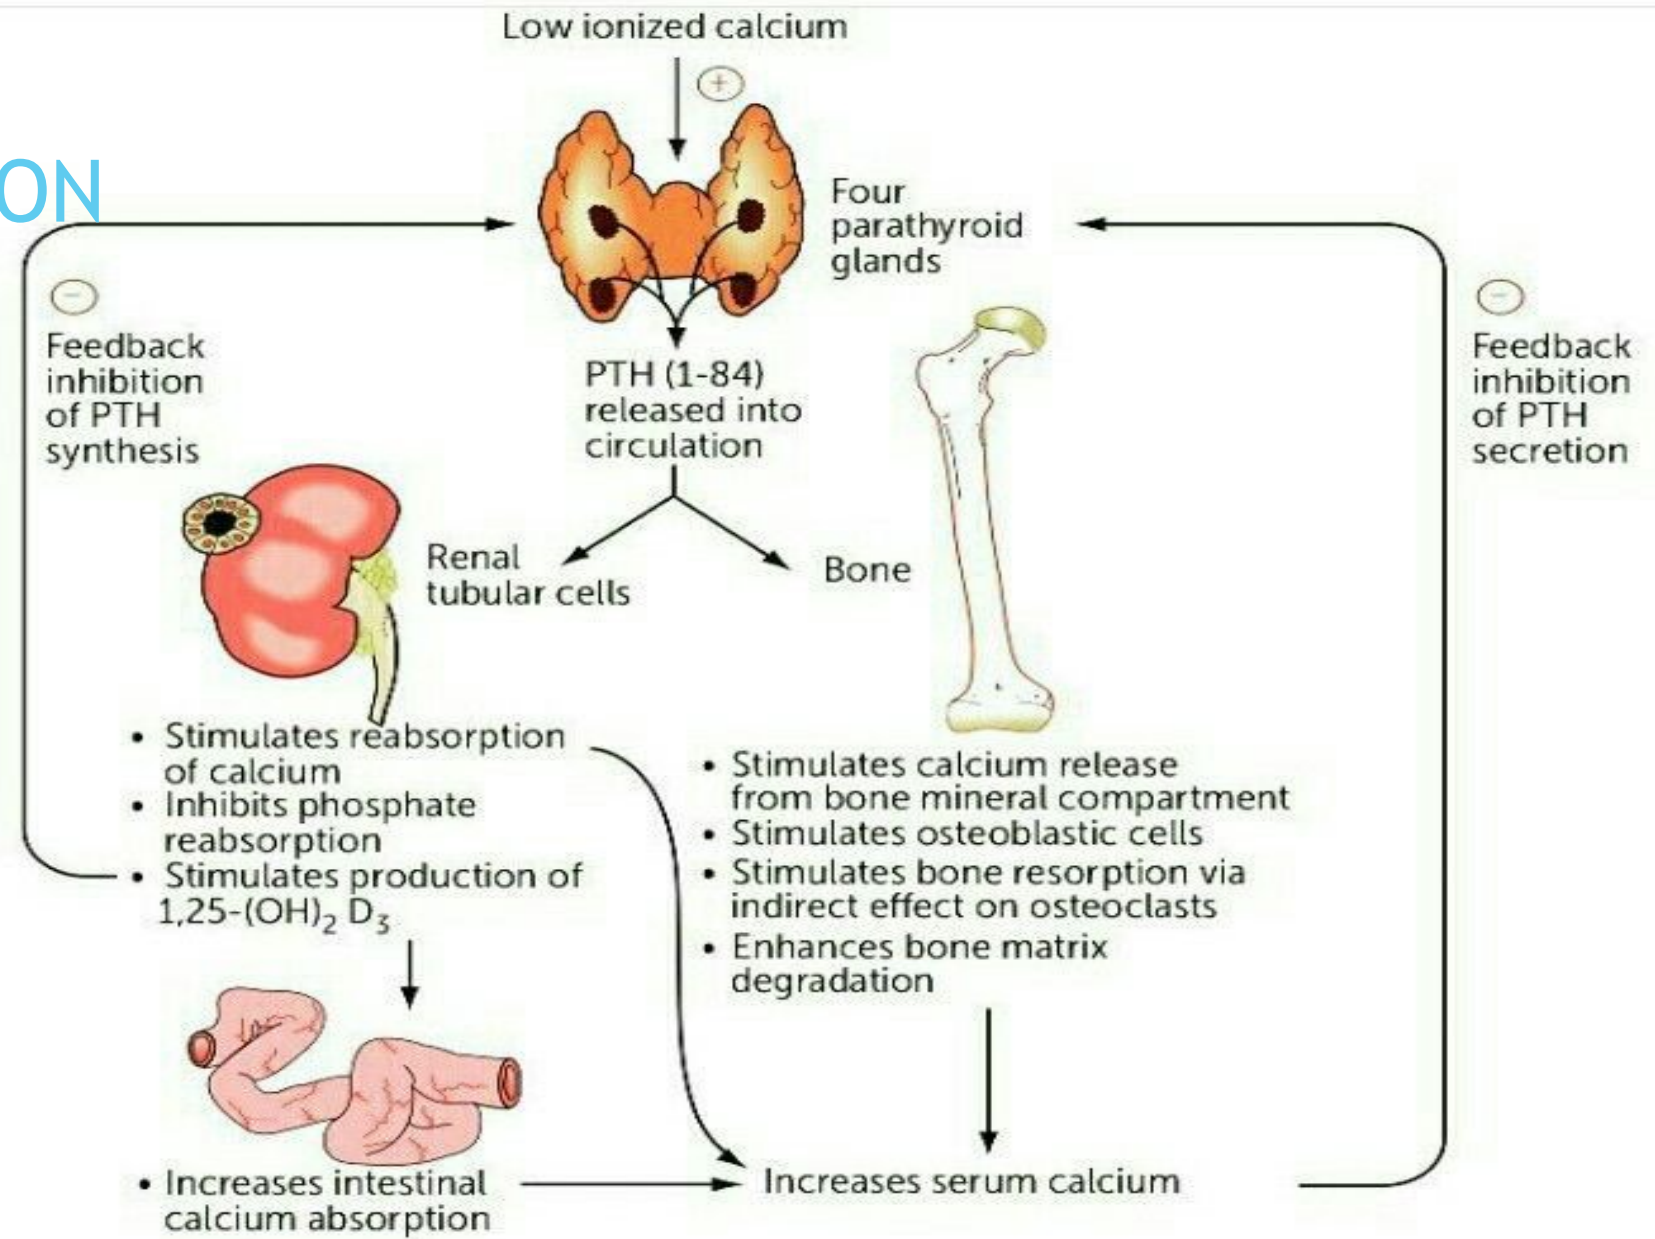

Acquired:

Cancer  
Pregnancy & postpartum period  
Oral contraceptives  
Hormone replacement therapy  
Polycythemia rubra vera  
Smoking  
Anti phospholipid syndrome  
Chemotherapy

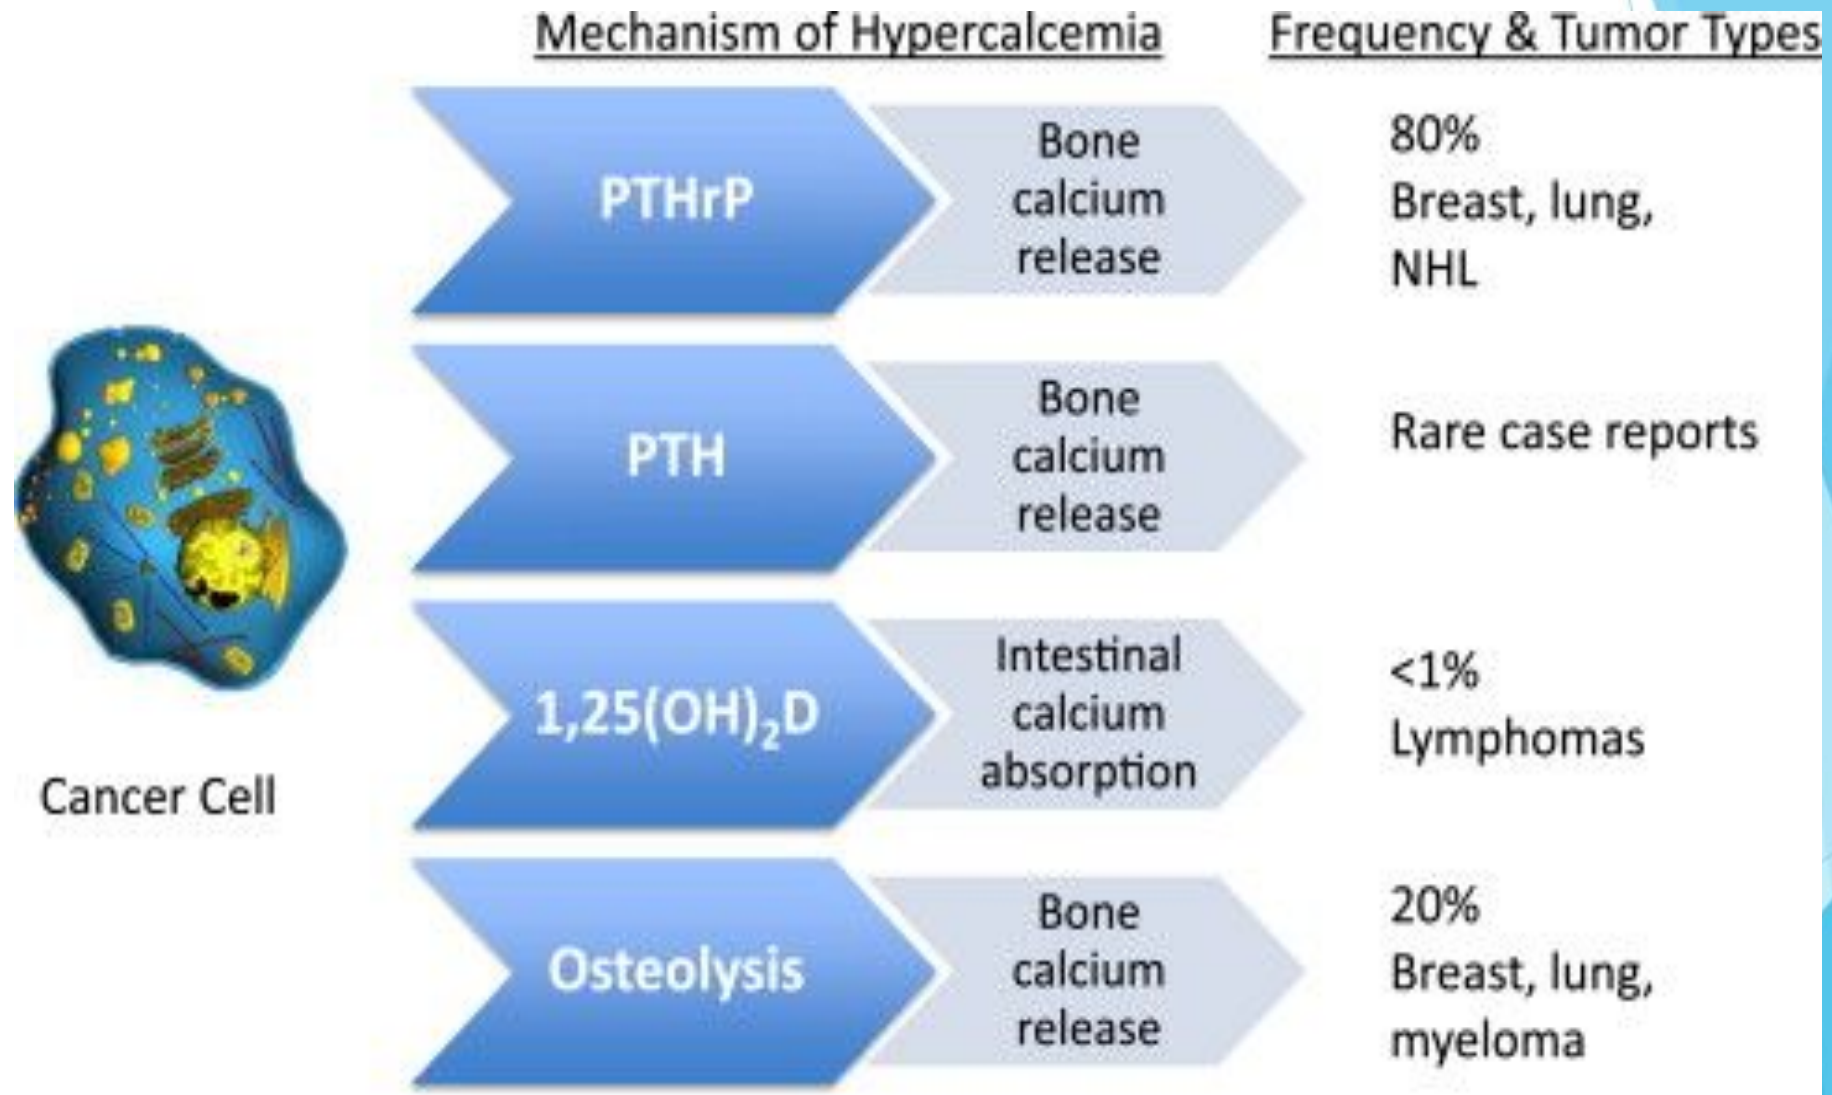

Risk for thromboembolism approximately doubles for each decade beyond age 60 years

# Endocrine System

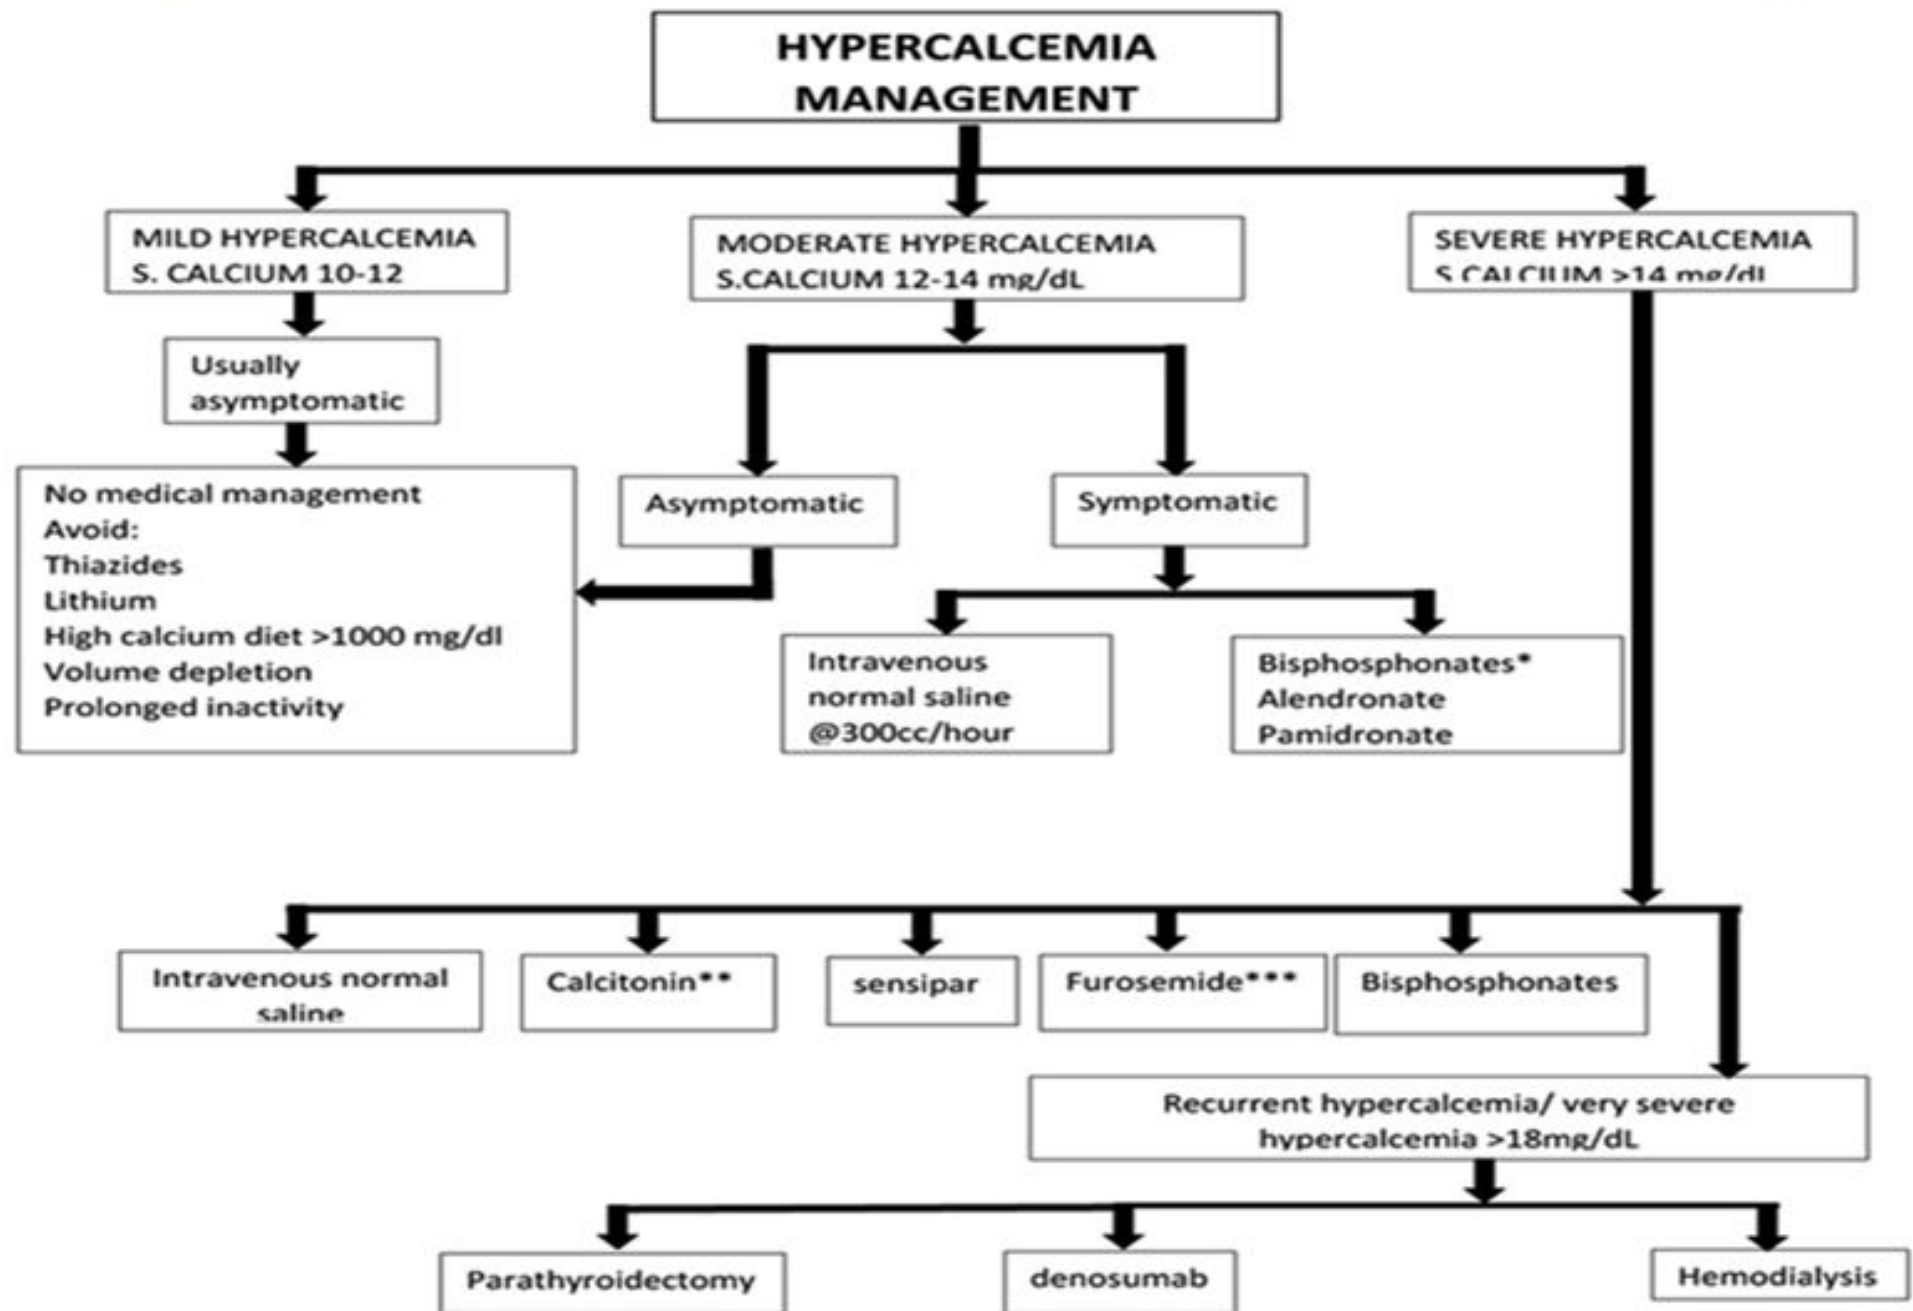

# ENDOCRINE: CALCIUM REGULATION

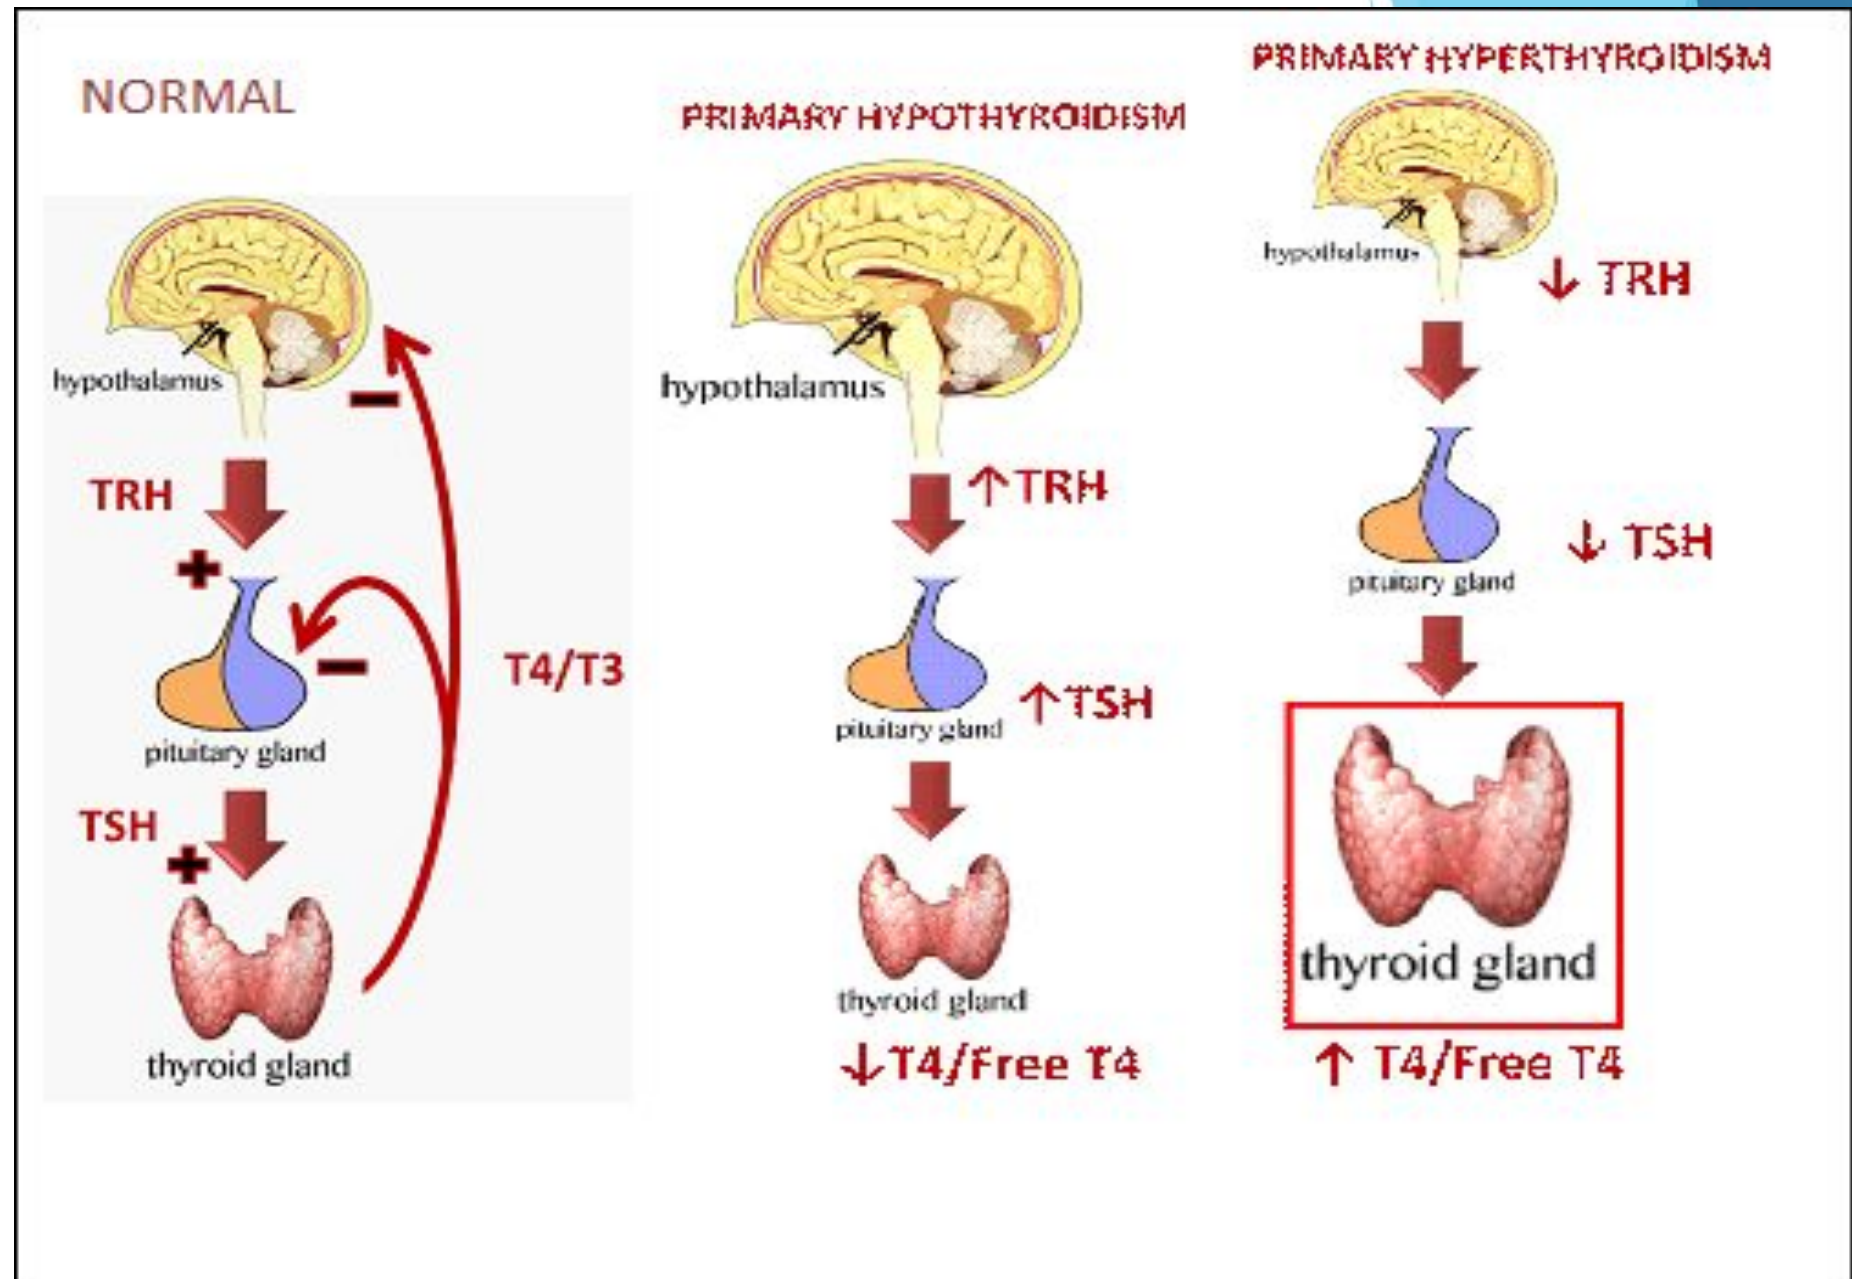

# MECHANISMS OF HYPERCALCEMIA

# MANAGEMENT OF HYPERCALCEMIA

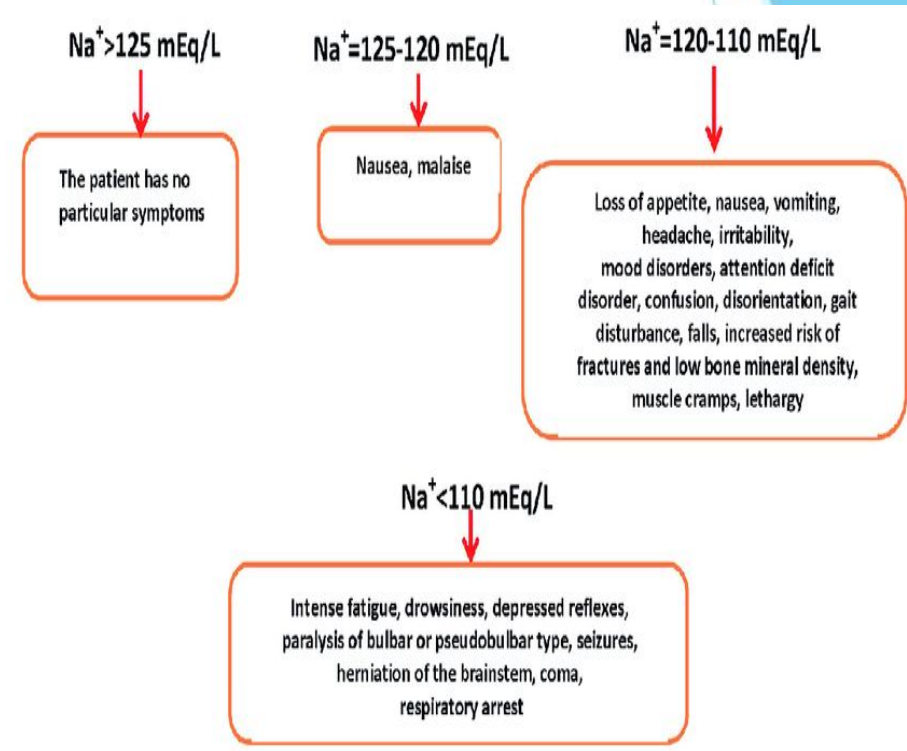

# ENDOCRINE: THYROID FUNCTION

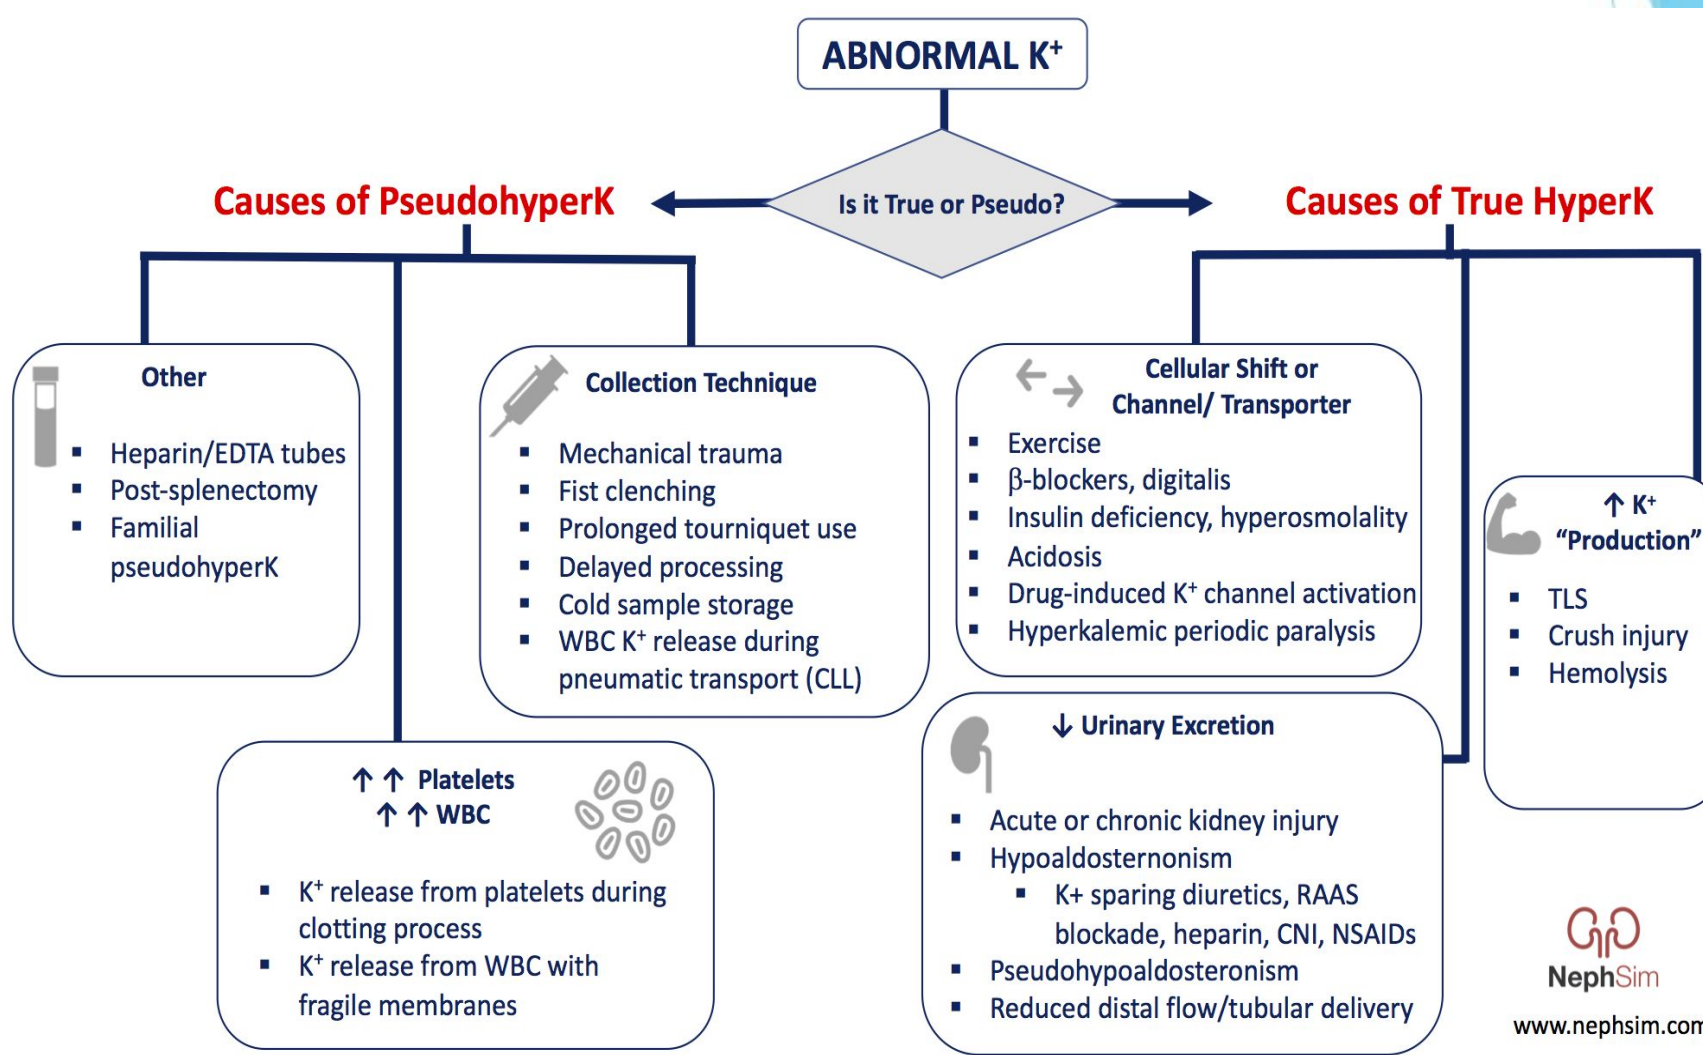

# ENDOCRINE: HYPONATREMIA

Type of hyponatremia	Causes
Euvolemic	SIADH Polydipsia Hypothyroidism Beer abuse
Hypervolemic	Edematous syndromes Cirrhosis Ascites Congestive Heart Failure Nephrotic syndrome Renal failure
Hypovolemic	Depletion of water and salts Gastrointestinal losses (vomiting) Diuretics Mannitol Adrenal insufficiency Nephropathy sodium-dispersing Cerebral salt wasting
Pseudohyponatraemia (hyperosmolar hyponatremia) Pseudohyponatraemia (laboratory artefact)	Hyperglycaemia  Hypertriglyceridemia Multiple Myeloma

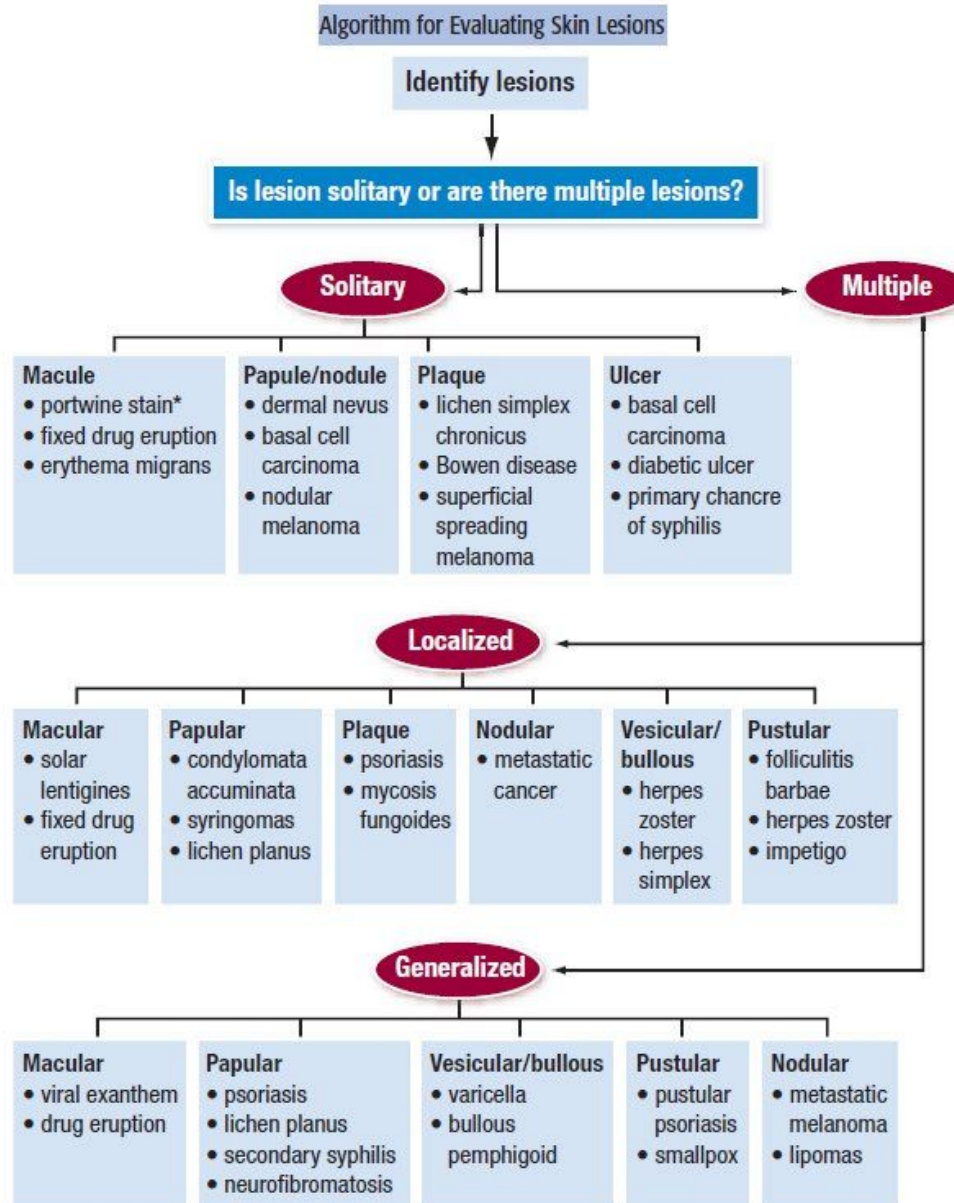

# ENDOCRINE: HYPERKALEMIA

# Integumentary System

# INTEGUMENTARY: RASH

## RASH ETIOLOGY TO CONSIDER

- EGFR INHIBITORS
- IMMUNOTHERAPY
- GEMCITABINE
- METHOTREXATE
- ALLOPURINOL
- ANTIBIOTICS
- SHINGLES

## Hypersensitivity reaction

# Erythema Multiforme

- Reaction of dermal vessels resulting in changes – papular and vesicobullous eruptions, **TARGET-LIKE LESIONS!**
- Palms, soles, mucosal membranes
- If severe, “Stevens-Johnson Syndrome”
- Causes: 50% idiopathic. HSV, Strep, pregnancy, SLE, drugs (sulphonamides, phenytoin, barbituates, penicillin, allopurinol)
- Tx: Treat cause. Symptomatic care (analgesia, IV fluids if unable to drink etc)

# PALMAR PLANTAR DYSETHESIA

Caused by cancer drugs affect the growth of skin cells or small blood vessels in the hands and feet. This causes symptoms that range from redness and swelling to problems walking. Repetitive activity such as walking, keyboard action, etc can make syndrome worse

Chemotherapy drugs:

Within first 2- 3 mos

- ▶ Capecitabine (Xeloda)
- ▶ Cytarabine (available as a generic drug)
- ▶ Docetaxel (Taxotere)
- ▶ Doxorubicin (available as a generic drug)
- ▶ Fluorouracil (5-FU)
- ▶ Floxuridine
- ▶ Idarubicin (Idamycin)
- ▶ Liposomal doxorubicin (Doxil)
- ▶ Paclitaxel (Taxol)

## Targeted therapies (within first 6 wks)

- ▶ Vemurafenib (Zelboraf)
- ▶ Axitinib (Inlyta)
- ▶ Cabozantinib (Cabometyx, Cometriq)
- ▶ Regorafenib (Stivarga)
- ▶ Sorafenib (Nexavar)
- ▶ Sunitinib (Sutent)
- ▶ Pazopanib (Votrient)

# PPE (NCCN)

## **Grade 1**

**Numbness, dysesthesia or paresthesia, tingling, painless swelling or erythema, and/or discomfort of hands or feet not disrupting normal activities**

## **Grade 2**

**Painful erythema and swelling of hands or feet and/or discomfort affecting ADLs**

## **Grade 3**

**Moist desquamation, ulceration, blistering or severe pain of hands or feet, or severe discomfort preventing work or performance of ADLs**

# RASH

Severity	Mild	Moderate	Severe
			
<ul style="list-style-type: none"> <li><input type="checkbox"/> Hygiene measures</li> <li><input type="checkbox"/> Hydration</li> <li><input type="checkbox"/> Sun protection</li> <li><input type="checkbox"/> Topical antibiotic cream                             <ul style="list-style-type: none"> <li>• Clindamycin</li> <li>• Erythromycin</li> <li>• Metronidazole</li> </ul> </li> </ul>		<ul style="list-style-type: none"> <li><input type="checkbox"/> Oral antibiotics:                             <ul style="list-style-type: none"> <li>• Doxycycline/minocycline 100 mg/12h</li> <li>• Alternative: azithromycin 250 mg 3 times weekly</li> <li>Cotrimoxazole 1 tablet/12 h</li> </ul> </li> <li><input type="checkbox"/> Pustules: saline/boric acid compresses</li> <li><input type="checkbox"/> Inflammation: topical corticosteroids                             <ul style="list-style-type: none"> <li>• Severe eczema: systemic corticosteroids</li> </ul> </li> <li><input type="checkbox"/> Refractory rash: oral isotretinoin (0.3 mg/kg/d)</li> <li><input type="checkbox"/> Pruritus: oral antihistamines</li> </ul>	

## Radiation sensitization and recall

Radiation interaction	Drug
Radiation sensitization and recall	Bleomycin Dactinomycin Daunorubicin Docetaxel Doxorubicin Etoposide 5-Fluorouracil Gemcitabine Hydroxyurea Melphalan Methotrexate Paclitaxel Vinblastine
Photosensitivity	Dacarbazine 5-Fluorouracil Methotrexate Mitomycin Vinblastine

Targeted agents	Cetuximab Erlotinib Panitumumab Sorafenib Vemurafenib	

# Scalp cooling

## Meta-Analysis: Risk of Scalp Metastases with Scalp Cooling

- 23 full text articles
  - 10 quantified the incidence of scalp metastasis with scalp cooling over time
- Results
  - Scalp cooling: 1,959 pts evaluated over ~ 43.1 mo.
    - Incidence rate of scalp mets: 0.61% (95% CI: 0.32% to 1.1%)
  - Non-scalp cooling: 1,238 pts evaluated over ~ 87.4 mo.
    - Incidence rate of scalp mets: 0.41% (95% CI: 0.13% to 0.94%)
    - P = 0.43 for the comparison

Rugo et al, BCRT 2017

## Safety: DigniCap Study

- Toxicity included grade 1/2 headache.
- Three discontinued cooling, primarily from feeling cold.
- No patient has developed scalp metastases with a mean follow up from last chemotherapy administration of 12.9 months (range of 6.7 to 18 months).
- Follow-up continues annually
  - No scalp metastases at a median FU of over 3.5 years

# Musculoskeletal System

# FUNCTIONAL ASSESSMENT TOOLS

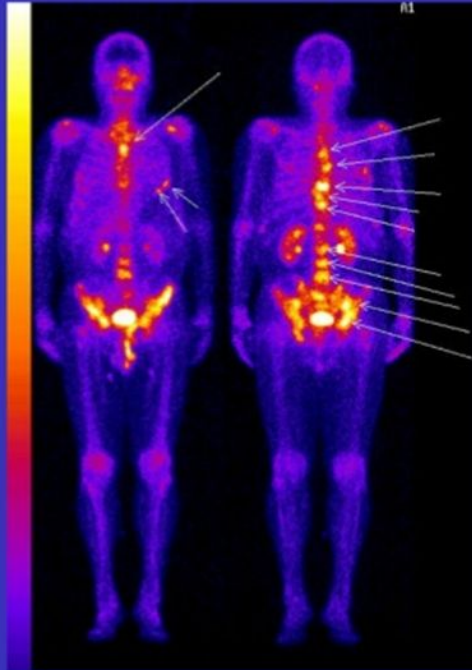

Karnofsky Performance Status (KPS) <sup>2</sup>	Eastern Cooperative Group Performance Status (ECOG) <sup>2</sup>
<b>100:</b> Normal; no evidence of disease	<b>0:</b> Fully active, no restriction in pre-disease performance
<b>90:</b> Minor signs or symptoms <b>80:</b> Normal activity with effort; some signs or symptoms	<b>1:</b> Restricted in physically strenuous activity but ambulatory and able to carry out light work
<b>70:</b> Cares for self; unable to carry on normal activity <b>60:</b> Occasional assistance required; capable of most self-care	<b>2:</b> Ambulatory; capable of all self-care but unable to work; up more than 50% of waking hours
<b>50:</b> Requires assistance, frequent medical care <b>40:</b> Disabled; requires special care/assistance	<b>3:</b> Capable of only limited self care; confined to bed/chair >50% waking hours
<b>30:</b> Severely disabled; hospitalization indicated <b>20:</b> Hospitalization necessary; requires active supportive care <b>10:</b> Moribund; progressing rapidly	<b>4:</b> Not capable of self-care; totally confined to bed/chair
<b>0:</b> Dead	<b>5:</b> Dead

## MUSCULOSKELETAL

- ▶ Muscle weakness and loss in advanced cancer
- ▶ Bone metastases common in breast (73%), prostate (68%), and lung (36%)
- ▶ Osteoporosis common (10-fold) in cancer patients
- ▶ Bone loss and muscle weakness increase risk for falls, fracture, death

# BONE DIAGNOSTICS

## BONE SCAN

A **radionuclide bone scan** is much more sensitive for detecting metastases than plain films. Not only are more lesions detected, but it is also an easier examination for the patient than a radiographic skeletal survey, which involves taking numerous films. Approximately 30% of metastases seen on a bone scan will not be visible on plain films.

## BONE DENSITY

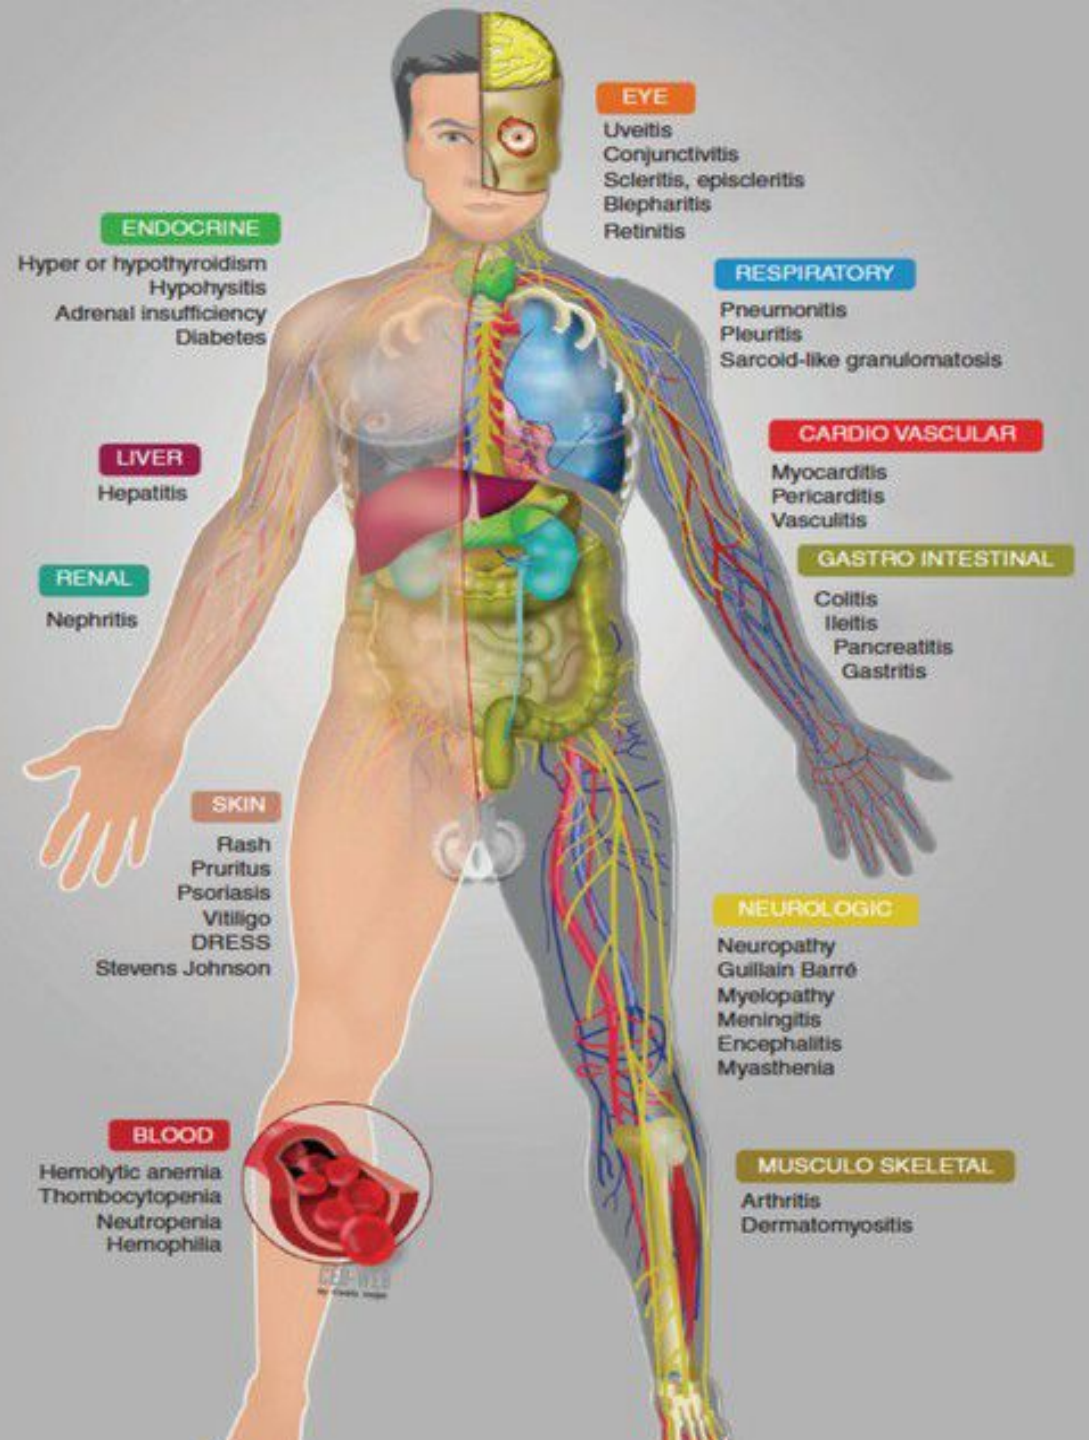

### WHAT YOUR T SCORE MEANS

T scores are measured in standard deviations (SD), statistical measures that reflect the difference between your bone density and the average bone density for healthy young adults of your sex.

# COMPLIMENTARY AND ALTERNATIVE MODALITIES (CAM)

## Overview of Complementary and Alternative Medicines<sup>1,2</sup>

Category	Characteristics of Treatment
Body-Based Manipulative Practices	Manipulation of soft tissue in an effort to affect the muscular and nervous system. Therapy includes massage, exercise, and reflexology.
Biological/Herbal Therapies	Vitamins, botanicals, and amino acids used to supplement the diet that are not considered conventional, and are not solely part of a diet or meal.
Alternative Medical Systems	Involves the use of non-traditional Western medicine. Practices include: Ayurvedic medicine, homeopathic therapies, traditional Chinese medicine, and acupuncture.
Mind-Body Therapy	Enhances the connection between bodily function and the mind. Such therapies include: meditation, tai chi, hypnosis, or yoga
Energy Therapy	Manipulates "bioenergy" to provide therapeutic results through light touch, positive expectations, and mind-body interaction. Examples include Reiki, qi gong, healing touch, and magnetic field therapy

# HERBAL PRECAUTIONS

Farinu, 2019

Herbal product	Cancer drug	Study type and description	Findings	References
Echinacea	Etoposide	Case report	Taking echinacea with etoposide was found to significantly decrease the platelet nadir ( $16 \times 10^3/L$ ) when compared to the nadir of etoposide alone ( $44 \times 10^3/L$ )	(13)
Echinecea	Docetaxel	Prospective study in 10 cancer patients	Echinacea did not cause significant alteration in the pharmacokinetics of docetaxel	(14)
Garlic	Docetaxel	Prospective, patient controlled, pharmacokinetic	Garlic was found to decrease docetaxel clearance. Although this decrease was non-statistically significant, it could potentially increase adverse effects due to accumulation of docetaxel	(15)
Ginseng	Imatinib	Case report	Patient taking imatinib for 7 years started having symptoms of hepatotoxicity after beginning to consume ginseng. Hepatotoxicity resolved upon discontinuation of ginseng	(16)
Grapefruit juice	Docetaxel	Case report	Grapefruit juice was found to increase the AUC and terminal half-life of docetaxel, while decreasing clearance of docetaxel	(17)
Grapefruit juice	Nilotinib	Open label, randomized, 2 period crossover	Grapefruit juice was found to increase the AUC and peak concentration of nilotinib but did not affect the elimination half-life	(18)
Milk thistle	Irinotecan	Pharmacokinetic study	Milk thistle was found to cause a statistically insignificant decrease in irinotecan clearance, making it unlikely to cause a clinical impact	(19)
St John's wort	Docetaxel	Pharmacokinetic study	St John's wort was found to cause a significant decrease in plasma docetaxel concentration	(20)
St John's wort	Irinotecan	Unblinded, randomized crossover study	St John's wort caused a decrease in plasma concentrations of active metabolite (SN-38) by 42%	(21)
St John's wort	Imatinib	Open label, crossover pharmacokinetic study	St John's wort decreased plasma concentration of imatinib by 32% and decreased the half-life of imatinib by 21%	(22)
St John's wort	Imatinib	2 period, open-label, fixed sequence study	St John's wort increased clearance of imatinib by 43%, and decreased its plasma concentration by 30%	(23)
